>Several other hams I know had the same problem. Pick another make
>of car!
>
>73, Mike KB3RG

Mike is right, but there is a fix. The noise is not ignition noise (at least in new Fords) it is hash noise from the electronic fuel pump. Ford has a kit that you can order and have installed at no charge when they build the car or later. When they build it is much easier!!! It is a filter that mounts on the fuel pump Ford P/N E7PZ-9B357-A 87-20-13 It takes 1.6 hours to install (after the fact, they have to drop the fuel tank) according to Ford.

5983. Icom R71A mod for < 100 kHz operation

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-07 00:00:00 UTC
From: gordonlm@u.washington.edu
Message-ID: <3tk8ni$iq3@nntp4.u.washington.edu>
Source record: 215576

I would like to operate a R71A at 20 to 100 kHz and understand that it is possible to do this by tricking the processor. Can someone forward this technique to me via e-mail?

Of course I would prefer a mod that makes the low freq operation more reliable. I am not particularly concerned with performance since the signal level will be fairly high.

Gordon Mitchell (206) 481-5577 g.mitchell@ieee.org

5984. Radio for 20 - 200 kHz wanted.

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-07 00:00:00 UTC
From: gordonlm@u.washington.edu
Message-ID: <3tk8tl$itb@nntp4.u.washington.edu>
Source record: 215577

I am looking for a radio that can receive FM/AM/SSB in the 20 kHz to 200 kHz region. Any suggestions? I would like to have it be small because I am going to carry it around. Sensitivity is not necessary since I will be using it to demodulate the output of another receiver (looking at subcarriers).

Gordon Mitchell K7HCV (206) 481-5577 g.mitchell@ieee.org

5985. Plectron and Motorola Alert Monitor Receivers

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-07 00:00:00 UTC
From: parnass@radioman.ih.att.com

Add a Plectron or Motorola Alert |
Crystal Controlled Monitor Receiver |
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author.]

In the 1960s and 1970s, thousands of firemen and ambulance
squad members came to rely on their transistor Plectron and
Motorola monitor receivers. They have now been replaced by
portable pagers, and are often available at hamfests in the
$5 - $25 range. Since many are in rough condition and need
repair, a hamfest special is better suited for hobbyists
who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are
excellent for dedicated monitoring of local frequencies --
a task for which you wouldn't want to tie up your 400
channel programmable scanner. They can be powered form
117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1, Plectron 700 series, |
and Motorola Alert Monitor is far better than any consumer |
grade scanner and the sensitivity, image rejection, and |
intermod immunity is outstanding when aligned properly.
The Plectron 500 series is less desireable. *

I use 6 Plectrons in my living room, 7 Plectrons down the |
basement and several Plectrons and Alert Monitors stored in |
reserve. The basement Plectrons are turned on |
automatically when someone walks down downstairs. Power to |
them is controlled by modified Radio Shack Safe House |
infrared motion detector, originally sold as an intrusion |
alarm. |

When a rescue squad member from Missouri advertised a |
number of Plectrons on USENET, I bought them -- all 20+ of |
them. I fixed and restored each one, recrystalled them on |
local frequencies, and distributed them to members of my |
scanner club who were glad to get them. |

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique | connectors and are scarce. You can buy them new but it's | much cheaper to drill a hole on the rear panel and attach a | permanent a power cord. Make sure you use a grommet in the | hole to prevent the metal chassis from chafing the line | cord.

Many Plectrons and Alert Monitors were equipped with an | internal NiCd battery pack, intended to power the receiver | if the AC power fails. It's unusual to find a used monitor | receiver with the NiCd pack still capable of holding a | charge. More often, the batteries have died and the series | charging resistor has overheated and burned. Be sure to | remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain. Parts for Plectron receivers are available from:

Plectron
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-2877

I currently have no Plectrons or Motorola Alert Monitors | for sale. I'm hoarding them. :-)

Thanks for the response!

Is their a technical difference, ie modulation, deviation, audio band-pass
or other that makes them different? Or ist it just because they haven't been
through the rigorous testing of commercial radios?

Cross-posted to: rec.autos.driving,atl.general,ga.general,rec.autos.tech,rec.autos.vw,rec.autos.marketplace,rec.radio.cb,rec.radio.amateur.equipment

I am getting my Stealth VRCD back from a maintenance session. The last time I tested the unit, it did very little (read as nothing) against police radar. Now, my friend with the two radar guns that we used is no longer in the state, so I need some help.

So, if anyone out there has either a X-band or K-band radar gun and would like to test this thing out or would let me borrow them - please let me know.

I live in Atlanta, but you sould send them to me (if that would be okay - we could arrange something so you'll see them again).

E-mail me or you can call 404-688-5907 and talk to my machine.

Thanks for the help and I'll post the results when available.

Carl

Most of the amatuer radios in the 2 meter band can be modified for out of
band
operation. However modifications to these radios does not mean that they
are FCC type accepted for the service that you wish to use them on.

5993. Kwd 940 slope tune/IRCI filter help!

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-07 00:00:00 UTC
From: turner@safety.ICS.UCI.EDU
Message-ID: <705.805154359@safety.ics.uci.edu>
Source record: 215586

Anyone know anything about the 940 slope tune circuit and what it does?
I just installed a pair if IRCI 2.1 kHz SSB filters in my 940
and they work except I lose all "high cut" on my slope tuning for
USB, and I lose all "low cut" on my slope tuning for LSB. This is
unacceptable, I can do better with the stock Kenwood filters using
the slope tuning control.

I called IRCI to try to diagnose the problem, and they asked if the
graphical display showed the slope tuning working, it does, but there
is absolutely no difference in receive passband for me with the high
cut in USB, low cut in LSB as I said. They said they could not help
me, I think they did not believe it was a problem. Frustrating.

Anyone have any ideas? Does the slope tuning move the 455 IF against
the 8.8 IF, and does this imply that maybe one switch is not working
and one half the pair of filters is not switching in? Is my master
oscillator frequency in need of a few hundred cycles adjustment? Of
course, that would affect the stock filters, too.

I have tried the simple adjustment of TC-1 and TC-2, they do adjust the
center frequency of the received SSB signal, but have no affect on the
slope tuning operation.

It just seems that the loss of high cut for USB and low cut for LSB should
be a clue that tells me what is happening. Wish I knew more about how
the 940 worked.

Source record: 215588

Hello all:

I seem to have found the problem. If any of you install the IRCI
filters and switch kit: note my previous message for symptoms.

Now, there are a few cans (transformers) right on the component side
of where they have you plant the 8.8 IF switch board. My ground
of the RG 174/U was touching a can. That was causing some coupling
around the filter, and made my filters look like junk. We rewired
and remounted, and the IRCI filters work very well.

IRCI service was, again, quite obnoxious and unhelpful. However,
a local tech was really great help.

How many of us remember hearing W5LFL of STS-9 fame on our HTs back in
the early 80s? He was using a 5 watt transmitter and I heard him Q-5
on my IC-2AT as he passed overhead over 100 miles up.

I won't say anything about the 200 mile plus QSOs I've had from 10,000
feet elevation in NM with an Alinco DJ-580 and less than 5 watts.

One thing to consider is that errors and omissions in repeater directories are
common. There may well be a PL needed. If your radio is of fairly recent
manufacture, it may be a model that can decode PL on receive. Try listening on
the input of the repeater for people who are getting into it. With PL Decode
enabled, step thru the available tones until you find the PL. Some newer radios
even do this for you, check your manual. Other wise, find an amateur radio
dealer or club in your area and seek local advice. A word of caution: The
repeaters may be PL'd for the purpose of Closing them. It is not good form at
all to talk on a closed repeater.

Xmit_ID version 1.60 shareware

Due to the interference problems that plague larger and even smaller repeater systems. Finding those people responsible can be very difficult. Yes you can DF them. Now you need to be able to prove it. The answer, "Finger Print" the radio. The price of this equipment can be out of reach for the average ham. Now with a modified radio, a used 386 computer, VGA monitor, 1 meg of memory and a Dos compatible sound card you can get "Finger Prints" of radios. This program with store them and compare them. It can be download on the internet from ftp:oak.oakland.edu /pub/hamradio/pc/ham-util/xmit160.zip or on Compuserve in the ham net form Software & Pictures directory XMIT160.ZIP. The cost to register this program is only $15.

Sure they can. I have a Icom24AT and though I have not done it, it can be modified to transmit in the 150MHZ band. However I will not do it as it is illegal. All radio's must be type accepted by the FCC except in the amateur service.

One of the repeaters I tried is crosslinked to a 2m repeater. That repeater
is not closed, so I doubt that the 440 one is. The radio can decode the PL,
but I need to get the optional decode unit which I just ordered. I can't
believe that every 440 repeater in the Rochester, NY area are closed (or needs
a PL).
Thanks for your help.

Greetings,

My name is Tim Jordan. And I am looking for the following at a
resonable/cheap price:

I need 1 of these:

E.F. Johnson Company's Viking Ranger or Viking Valiant

or any ham transmitter that has the following features:
1: 160 meter capability
2: amplitude modulation
3: plate modulation
4: operational....

Thanks, if you have any of these please e-mail me at: multifreq0@aol.com

thanks in advance....

JB>Still looking for extended recieve mod for the v21!!I tried the

The only extended receive mod for the V21AT is for the 220 band.

Open up the radio and cut Diode D23 on logic unit and reset the
microprocessor. (press and hold [FUNC] & [A] & [*] & turn power on.)

It doesn't open up the 2 meter side though.

Check out the ads in 73 Magazine, QST, CQ Magazine, Popular Communications, Monitoring Times, or Nuts and Volts. All of these magazines carry adds from people who sell kit and assembled versions of DTMF decoders.

I just took my license tests tonight and now I am faced with the next step finding a radio. I have been reading this group for a while and would like some advice in what I should buy. I would like something car-mountable. I think a dual band 144/440MHz sounds interesting, but I don't want to leave out the 800-900 MHz band. Are there any "tripple band" radios out there which combine these bands? Or Dual bands which can be modified or expanded to receive? Please E-Mail any suggestions.

Thanks

D Tyler

Yes, many of them can be modified to transmit out of band. No, you cannot
do it legally. Commercial radios require "type acceptance", which amateur
radios do not, in general, have.

>you turn it on. Could this be that the Battery in the Radio is going
>dead, since it works fine once you are able to get it on frequence?
>
>
The battery will not cause this. The battery backs up the operating program for the radio.
I would suspect some other trouble. describe just what the problem is.
Just saying it will not get on frequency is not very much to go with.

6013. Puerto Rico Credit Card Fraud occurrence

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-08 00:00:00 UTC
From: jaya@multimedia.hqsl.stratus.com
Message-ID: <jaya.22.0003087A@multimedia.hqsl.stratus.com>
Source record: 215514

I am the system operator of a BBS in Massachusetts. I received a call as a direct result of someone who read an earlier posting of mine. This individual utilized a credit card that was less then totally legal if you get my drift. Further more, this ham resides in Puerto Rico and had a general interest in the TH-28Aand Alinco products. If you need a file for ham radio stuff so bad that you have to commit fraud, I'll gladly give you the damn file, but don't try to steal from me. All hams take notice!! I will post this individuals full name and call if taunted further.

To the person in Puerto Rico "Raph...", I know exactly what your upto and have been able to prove it through VISA headquarters and the Canadian bank.

There are always a couple of bad apples, to all of the honest hams (most of us) take notice!

6014. Comm. Concepts Amp Kit Experience?

Hello everybody,

I'm looking for an article from QST'93 about how
to build a computer interface for the TS50 yourself.
Unfortunately the library down here has discontinued
receiving QST in 1992!
Anyone who could help me somehow please respond by
email. I'm not sure but possibly this article
is also in one of these nice ARRL-handbooks.

If you have bought the computer IF from Kenwood -
does it come with drawings / circuit plan?
I could use them, too. And of course any comments/
experiences welcome.

If your application is in a foreign country you could do this. If your
application is in the US, forget it. To do this legally would require
obtaining type acceptance from the FCC, a long and expensive process.

At the end of this month I will be buying a new HF rig. I have gather all the information I can from back issues of QST other sources. The HF rigs I have considered are JRC 245, ICOM, 736, YAESU FT 990 and maybe even a used KENWOOD TS 940S/AT. I think I have eliminated the JRC 245 because of cost and it's ability of software for rig control. The problem I have is in the reading of the specs. although I'm not an expert in this area it seems the KENWOOD 940 even though used stands out comparirly and above the YEASU 990. I'm I wrong? Do we have any pros and cons about any of these rigs? I just sold my KENWOOD 930 and need to buy another rig soon. Thanks for any info.

6020. Followup to Icom Z1A transmit problem

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-08 00:00:00 UTC
From: js024b@uhura.cc.rochester.edu
Message-ID: <1995Jul8.190626.3002@galileo.cc.rochester.edu>
Source record: 215597

I had a posted a message before about being able to receive 440Mhz repeaters, but not able to trigger any of them. I went over to the local Radio Shack, and confirmed that I am able to transmit on the 440 as the RS scanner picked it up without a problem. The repeaters have no listed PL tones, the offset is correct, and the direction of it (+, -) is correct as well. This problem occurs both with the standard 1.6w battery pack, and my 20w amp in my car. Any suggestions?

Thanks.

I published this article back in April 1985 Monitoring Times.

TRICKING THE ICOM R71A TO TUNE BELOW 100 KHZ

Copyright 1984, 1985, Bob Parnass, AJ9S

The ICOM R71A general coverage receiver is designed for
VLF reception down to about 97 kHz.

The following steps will confuse the microprocessor-based
controller sufficiently to permit reception down to 0.0
kHz:

1. If all 32 memory channels contain frequencies, use
the FUNC and CLEAR buttons to clear a memory
channel.

2. Place VFO/M switch into the M (Memory) position.

3. Using all the manual dexterity you can muster, rock
the MAIN TUNING knob back and forth, while
simultaneously rocking the MEMORY-CH rotary control
to switch back and forth between a memory channel
with a frequency in it and a clear memory channel.

Continue rocking both the controls until a frequency
of 0.000.0 appears on the digital display.

4. Depress the WRITE button. This stores the 0.000 MHz
frequency in a memory channel.

You can now rotate the MAIN TUNING knob clockwise to
tune up from 0.000 MHz to the frequency you want.
Be careful: if you rotate the MAIN TUNING knob
counterclockwise, the radio will immediately revert
to 29.999 MHz.

To tune below 100 kHz in the future, just recall the 0.000
MHz frequency from the memory channel and use the tuning
knob to tune upward. That way, you don't have to use two
hands every time you tune to a VLF frequency.

I used a Wavetek 180 sweep/function generator to verify
that the R71A is indeed receptive to signals below 100
kHz.

Illogical John, you might as well be against the man in the moon
because he never changes his expression. It is illegal to screen out
non-hams. Now if RS happens to be selling a used amplifier capable of
the amplification of RF below 120 MHz...that is another story. Para
97.315(b)(5) of Part 97 of the FCC Rules.

>Why blame RS? It's not their place to police the ham bands. Besides, it's
>not illegal to buy any radio equipment that is capable of transmitting; it's
>only illegal to transmit without the proper authorization. At that point,
>it's a regulatory problem over which FCC has primary jurisdiction. Whether
>they choose to act or not, it is still an FCC problem, and not RS.

Jim is 100% correct.

>Tell you what...go into HRO, AES or any other store that caters to hams, and
>attempt to buy a HT. My bet is that they will sell it to you anyway.

Yup...

>Better yet, try mail order.

Yup, via mail order also.

I have personally sold many radios, VHF, UHF, VHF/UHF, HF, etc. (not
necessarily in that order) to non-licensed individuals. THAT IS NOT
against the law....what IS against the law is non-licensed
transmission... What a person does with radio transmitting equipment
after purchase is between that person and the regulatory
agencies...it's not up to the dealers to screen out non-licensed
individuals. Sorry John....it don't work that way.

From: tjenkins@pnet16.navy.mil
Message-ID: <DBFH39.615@nctamsep.navy.mil>
Source record: 215524

Anyone that could send me a schematic, or manual (preferred) on an older CDR-2 type rotor system? It's many years old, square bakelite brown control panel, with five position switch at the bottom front (rotate-show-off-show-rotate) and the rotor motor is a bell shaped unit.

What I'm really looking for is internal parts, and wiring diagram.

Failing that, anyone know of any repair shops that rebuild these old puppies?

6032. Looking for info on Yaesu FT 747 GX

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-09 00:00:00 UTC
From: russeles@aol.com
Message-ID: <3to0a1$1tl@newsbf02.news.aol.com>
Source record: 215525

I am looking into investing in some low band equipment and I am wondering if anyone has any info on the Yaesu FT-747 GS 160m thru 10m tranceiver. It looks
like a decent rig and is priced about $520ish. I am looking to see what people think and about when this radio would have been produced. This is my first time with low band equipment so I'm a little lacking in knowledge.

Thanks
-- Erik, KB8ZFS

6035. Icom IC-230 question

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-09 00:00:00 UTC
From: dhughes@prairienet.org
Message-ID: <3toif7$83i@vixen.cso.uiuc.edu>
Source record: 215528

I have an older mobile, an Icom IC-230. The power switch is a toggle switch that can be thrown to either DIRECT position or REPEAT position. The manual simply says "Place the Function switch in the Direct position." There is no mention in the manual of when the Repeat position is used, or what it does. There is a separate toggle switch to choose plus or minus 600 KHz for repeater operation, so I don't think the Repeat position is tied to repeater use (I don't have an antenna for this radio so I haven't hooked it up yet--just bought it yesterday). Thanks for any enlightenment.... ---Dan

Looks like I made a mistake in posting this article, please let me repost. Recently just sold my KNWD 930. I have been considering one of four rigs to buy. JRC 245, ICOM 736, FT 990 and even a used KNWD 940. I have pretty much eliminated the JRC 245 because of software for rig control. I have look at all the information I can gather on the other rigs from QST and other sources. I'm no expert in reading specs, but it seems to me the KNWD 940 stands as tall as the FT 990 and then some. Can I be wrong, does anyone have any experiences with these two rigs? I'm leaning towards the FT 990 but a used KNWD 940 is not out of the picture and I will not consider the ICOM 706.

The only mod outside of a 9600 internal packet mod is to open the tx from 140-174 Mhz. There is no expanded rx mod. To open the tx, remove the top cover, locate and cut the thin green wire atop the pc board, and that's it. 73/Terry VE4UC

6053. Re: 6 m AM rig, Does anyone use them?

Source record: 215546

6M AM is popular around the Washington DC area. They have a Sunday morning net on 50.400. Judging by you N7 call you are probably not in the DC area. Try contacting some local hams to see if there is any local action.

Some other choices include: Modifying it for CW, Making a CW beacon out of it or making a BFO so you can receive SSB. AM signals can be received on SSB (although some ops may not like the heterodyne).

Hello everybody,

I'm looking for an article from QST'93 about how
to build a computer interface for the TS50 yourself.
Unfortunately the library down here has discontinued
receiving QST in 1992!
Anyone who could help me somehow please respond by
email. I'm not sure but possibly this article
is also in one of these nice ARRL-handbooks.

If you have bought the computer IF from Kenwood -
does it come with drawings / circuit plan?
I could use them, too. And of course any comments/
experiences welcome.

Source record: 215453

Many 440 repeaters are utilizing PL (CG for you GE fans) not to be "closed" but as a means of fighting intermod. Many of the older UHF repeaters that are used for HAM did not have the best helically filtered front ends, etc, so, using PL was an added means of preventing random intermod induced transmissions.

In many metropolitan cities, you'll find most UHF repeaters utilize the CTCSS squelch.

Hi Lynn,
I recently purchased the Icom Ic-736 and really enjoyed the radio until I tryed to use 80 and 160 Meters , I found that those bands were usless because of the Interference from the commercial radio stations , there just wasn't any rejection at all. On 6 meters there was a simular problem with out of band signals but not as bad. To make a long story short and two 736's later I ended up with a kenwood ts-850-sat for about the same price. I don't have any problems with it.

Message-ID: <3tqidq$s3u@tilde.csc.ti.com>
Source record: 215457

Hi, I also experienced similar problem with the
IC736. I've heard the 738 is a better rig, but have
not tried it yet. Too bad Icom stopped making the
751A, as this was a pretty bullet-proof transceiver.

I believe the Yaesu FT-890 and FT-990 would be a
better choice. Both have excellent receivers. The
990 comes in an AC-model (built in power supply) and a
DC model (to be used with your own supply). The
FT-890 is no longer manufactured, but still available
from AES. At about $1200 for the 890, the price is
right and performance is good. I've had one for 4
years and wont trade it!

Hi--

Anyone figure out how to expand the TX range or the
VHF (6 meter) TX/RX coverage for the new Alinco DX-70
radically small mobile HF rig?

I opened it up but didnt see any yellow/blue or green
wires that are labeled "snip here".

Thanks, BV/N0IAT

6066. 900 MHZ with th-79a ????

No such animal exists. The schematic for the 800 MHz section of the
radio pretty much shows why (it's part of the receive section only).

Sorry....

David,

Do not waste too much time in the search of a service manual for the IC-471 radio.
There never was such a manual, only the IC-271 had a service manual. I can tell you
that the output of the PLL needs to be with in 1 db for the entire tuning range. And the
typical
service monitor spectrum analyziers do not cut the muster when working on this radio. theu

do not go low enough in level, and if they do they are not calibrated close enough. Icom uses an 18 GHz spectrum analuizer for this job, Ship the radio to them you will be glad you did.

Gary

6069. How safe is a 900mhz cordless phone?

RTFM. There's a keyboard/keypad mod in there that opens up
MARS/CAP frequencies, so no need for a hardware mod. Whether it can be
opened up further is another question.

As a safe guess, pulling that AGC pin to a value between +2.2 and +2.7 V or so makes sense, because this is the voltage applied to Gate 2 of all of an FRG-7700's AGCed 3SK73 dual-gate MOSFETs when no signal is present.

The standard work-around for this is a flagpole. Its base is carefully constructed to be insulated and provide room underground for a remote-control antenna tuner. Not very directional but *very* patriotic. Only works for HF of course.

Gordon Mitchell K7HCV

6085. R-388 with mech. filters?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-10 00:00:00 UTC
From: dlr13@psu.edu
Message-ID: <dlr13.4.300158EF@psu.edu>
Source record: 215478

At Timonium MD hamfest yesterday, a tailgeter had an R-388 that had mech. filters built into it. This was either original from the factory or a field mod. The order # on the radio was: 25067 PH 54/55, the s/n was 67. The only external difference noticeable was a metal tab that controlled the 3 position switch mounted under the bfo pitch control. It still has the crystal filter and controls.

My questions:

I have an R-388 with the same order #, s/n 80. It does not have the mech. filters. Does anyone know if the order was mixed, (some with xtal, some with xtal and mech.) or if all radios were modified after delivery. Any information at all appreciated.

What does the 54/55 mean in the order #? I always thought that it indicated when the order was placed, thus giving an indicator of age. Indeed, any information on what the order # as a whole means would be appreciated.

I don't think you are going to find a 2m radio that will work anywhere near CB freq's since 2m is 144Mhz and CB is 27Mhz. The only way you will get 460Mhz is with a radio that also works on 70cm. There are several dual band HT's available that will work both 2m and 70cm. Good luck.

I agree. The best investment is in some good quality sheilded cables for your
periphials. Dataspec makes a good line. Several others exist as well. Even the
power cords for your monitor and cpu should be shielded.
Good luck.

Jim...

You have several choices.

1. MFJ makes a blank cable terminated in RJ45 for Yaesu rigs.

2. Any computer or office supply store that handles computer
networking supplies should have 10-Base-T cables that are
RJ45-terminated. One premade cable will supply you with 2 ends.

3. Radio Shack catalogs an RJ45 connector in their telephone supplies.
I have not seen this one, or used it, so I can't confirm it.

Good Luck

> 73's
> Bob N3LSS

I have a 737A and have had a 737. Both of these radios are the same as the 738 with some software differences. I really like my radio and have found it to fit my needs in every situation. When I compared features of radios the 850 did perform better; however, there was a significant difference in price between the 850 and the than 737.

Some things to consider are the 738 uses AF for its notch filter and the 850 uses IF (I think), the 850 offers cascading filters, 738 doesn't. The 850 I

think has a narrow SSB filter the 738 doesn't.

IMOH I don't like the display on the 850. I can read my 737A at about 20 feet, but this is a minor point. I like the kenwood mike circuit better, if your going to use a heil mike you may have some problems, icom is a little inconsistent with this circuit and I had to get an engineer at heil to kelp and ended up returning the heil for the SM-20 desk mike.

The receiver was the area I concentrated my search on and for the money the 737 had a better receiver according to tested specifications not advertised than all the radios in its class accept the 850.

What I would do before spending that kinda money is trying each radio out. You might check your local area for a ham who has each radio and see if you can arrange a demo, of if your near a HRO go and spend the afternoon with each radio. Read the manuals try to do things with the manual to see how well it is written Either way I'm sure you will be pleased.

I have an older ICOM 255 (2 meter rig) which is in need of service.
I purchased the radio used, and did not get a schematic. Can a kind
soul provide me with a phone number or address for ICOM here in the
states?

Optionally, can anyone provide a schematic for this radio? I can
possibly help you with a copy of an HP manual.

Thanks much,

Kevin

The statements/opinions expressed here are not necessarily those of the
Hewlett-Packard Company. HP paid a research firm millions of dollars to
get their own opinions, and has made it clear they do not wish to share mine.

If it is like my Polytronics 6 and 2 m AM rig, it is so frequency
sensitive to vibration you can just yell at the case and use it for an
FM unit. ;-)

6100. Good Yaesu & Icom service.

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-10 00:00:00 UTC
From: dcassell@lynx.dac.neu.edu
Message-ID: <3tsa0s$e1v@chaos.dac.neu.edu>
Source record: 215493

I have noticed a few messages posted by folks looking to get an Icom or Yaesu fixed. I had my Icom rig once to Icom factory service (in GA); it took 12 weeks to get my radio back and the problem persisted. I'd never send it back there again.

I sent my IC-725 to AmPro Communications, run by Mike, AD4QB. My rig had a PLL failure and wouldn't receive - he fixed it in 2 weeks and had it back here running flawlessly. He's an authorized Icom and Yaesu repair company. I'd HIGHLY recommend his company to anyone wanting to have a radio repaired quickly, economically, and done RIGHT.

Ampro Communications
4500 S. Main St. Suite 104
Acworth GA 30101
404-974-7710

Not affiliated, just a very happy customer with a radio that was fixed right.

You did not specify if this would be vhf or hf. A flagpole is a good
disguise antenna for hf, as suggested by someone else.
For vhf, someone manufactures a "Ventenna" for 2 meters I believe,
which looks amazingly like a sewer vent pipe :)

The flagpole is a nice idea if your covenants allow it. However, many covenants won't allow a flagpole either. Please review your covenants and read them carefully. Then give us an outline of your needs, like UHF, VHF, HF, QRP or full limit, etc. That will help you get better suggestions!

6110. on finding magazines (was:HELP: Article QST Febr.93)

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-11 00:00:00 UTC
From: Michael.Black@juxta.mba.org
Message-ID: <3d6_9507120654@mba.mba.org>
Source record: 215351

thees@eos.ncsu.edu (Hans-jurgen Thees) is looking for an article
in the February 1993 issue of QST on building a computer interface
TS-50. He checked the library, but they stopped getting QST before
that issue.

ONe really important thing to remember when looking for an old
article is that the magazines often have old issues available. If
the particular issue you need is out of stock, they often will provide
a photocopy of the article you need. Of course, you're expected
to pay.

Often I see people asking for things like a back issue or a manual
for a rig, and the obvious place to check first is the original source
I find this especially important because most computers don't come
with a slot to slide in an old magazine to teleport along the internet
to the person wanting it. So everytime someone asks for something
that is readily available, albeit at a cost, it means that someobody
has to go to the trouble of digging up the article, photocopying it,
and then putting it in an envelope and maybe even having to go to the
post office to make sure the postage is right. That kind of effort
is much better reserved for articles or manuals that are hard to come
by.

It would be nice if the magazine publishers made the process easier.
Like putting a cumulative index on-line in some form, so people could
get a computer to do the searching for them. Then the publishers
could sell you the article you need.

Unless they have changed their policy, you can get back issues of
QST from the ARRL. An issue from two years ago should be very
available. I also know that they also use to have a policy of
providing a photocopy of the needed article if they didn't have
the issue in stock. I forget how much they charged per page,
but it was a fair cost if you needed the article.

My ATT9100 uses digital audio sent via WBFM. Essentially impossible to
monitor.... unless you build a decode with a fairly common MC3418 and
attach it to your receiver.... listening on a conventional analog
NBFM receiver you don't hear anything.

More accurately: it's virtually impossible to eavesdrop on a *digitally-encoded*
900 MHz phone. If the manufacturers choose to make the 900 MHz transmissions
"in the open", or speech inverted, eavesdropping would be simple and
possible.

Depends. There are two kinds of 900 MHz phones. The ordinary analog
phones can be scanned. The digital SS phones cannot (at least not
without additional equipment).

Remember that it is only as safe as todays technology, tommorow when
I make my special wiget to decode then it will not be safe.

>encoded* 900 MHz phone. If the manufacturers choose to make the 900 MHz
>transmissions "in the open", or speech inverted, eavesdropping would be
>simple and possible.

Yes speech inversion is simple & very possible but I take exception
to the previous statement, "it's virtually impossible...*digitally-
encoded* 900 MHz phone." Impossible? The base portion of the phone
does it so doesn't it follow that some other properly configured
device could do the same? I believe so but of course I don't speak
from experience on this one, that would violate the EPCA.

To answer the original question no it is not impossible. Different
900 MHz phones use different technologies. Some can be heard by
a typical scanner, others can be heard but with more effort required
to do so and some are extremely difficult or just not figured out yet
but I would NOT say impossible. The safest thing on any phone that
is not wired to a wall is to always assume that someone is listening.
Just don't bad-mouth the neighbors or give out vital info.

Auto atus that fit inside small radios have limitations. If they try to tune loads that are fairly close to 50 Ohms, resistive, they give lowish loss, try to use them on more difficult loads and the losses climb fast. You can also wind up with currents and voltages that badly stress the ATU components, even at 100w.

As a rough guide, the typical internal ATU will give you as wide a load tolerance as typical valve (tube) radios got from their Pi-tanks. not having 160metre coverage may be a nuisance, too.

Built in ATUs in large, flagship, radios are a bit better, having larger components, capable of withstanding greater voltages and currents, but even they cannot compete with the abilities of good quality external units.

Remember that it is useless specifying atus in terms of power handling. It is the flashover voltage, and the max current ability that determines what power can be driven into what load.

Whether you think the internal job is good value depends on what you want it to do. If you are not interested in topband, or want to tune antennae which are not far from resonance, anyway, then you may find it convenient. If you want to use longwires, doublets, or any less than ideal antenna, or try 160m, then it will disappoint you.

Some antennae only give a VSWR into which average solid state output radios can develop full power over parts of some amateur bands. The value of these tuners lies in allowing you to widen these zones somewhat. These comments apply to all makes.

Cheers
David GM4ZNX

>Is there any reason that RG62, 93 ohm cable can't be used? I realize
>the velocity factor is different so there would be a slight lenght
>adjustment to make. But does the impedance matter?

Yes. The Bazooka antenna achieves increased bandwidth by
providing a shunt reactance of opposite sign to that of the antenna
off resonance. The reactance supplied by the stub is proportional
to the transmission line impedance and ideally is somewhere around
10 - 15 ohms for typical implementations. 50 ohms is bad enough
but 93 ohm cable won't do much except add dissipative losses. Typically
when using 50 ohm cable about half the broadbanding is due to the
additional losses and half due to the reactance compensation. All
things considered, the Bazooka is not a very efficent antenna compared
to the alternatives.

Does anyone have any experience with the BILCO ICOM PERFORMANCE MODIFICATION from Bill Rohrbach, KB3PJ? I received his advertisement sheet and it looks pretty good. But I wonder if changing to PIN diodes in the RF and IF sections of the receiver really helps that much, especially in an ICOM 735.

811's have much lower plate dissipation so you cannot obtain power out=20
you would get with 572B's. 811's like plate voltage less than 2KV,=20
whereas 572B's like about 2.5-3KV. 572B has higher mu than 811. I've=20
substituted 572B's for 811's, and had to beef up the plate supply to get=20
full advantage of tube. A lot of people with 811 amplifiers substitute=20
directly with 572B's with no changes and it works fine; tubes will last=20
longer and take more abuse. Gud Luk.

I found a source that says that the NASA select shuttle broadcasts are repeated on 448.975MHz and 449.000MHz here in Phoenix. I heard some non-shuttle traffic on these freqs but not a single shuttle related transmission during the last flight. With another flight happening this week (hopefully) I would like to know if anyone in the Phoenix area was successful in hearing rebroadcasts on these freqs or if they know of other freqs to monitor? Thanks.

This filter mod has met with mixed success. I know folks who report the
Ford RFI filter cleaned things up completely. On my '92 Explorer, their
filter dropped the noise from S9 to S7, still unacceptable in my book....

No problems on VHF or UHF, though. Just HF....

Any HT with a receiver front end as wide as the typical ham HT is
likely to be prone to intermode. Some are worse than others. This is
just the price you pay to be able to snoop on the cops and the
fire dept.

If you want a toy, buy a Icom/Yaesu/Kenwood rig; if you want a
communications tool, buy Motorola.

>information at all appreciated.

I understand that mechanical-filter retrofit kits were available for
R-388s (civilian designator, 51J-3s) to turn them into the equivalent
of 51J-4s (51J-3 with mechanical filters, plus [I think] another stage
of IF amplification to offset the high filter loss). I had an R-388
that had filter bandwidths screened on where the added thumbswitch
would have gone; probably, its front panel was a replacement.

Source record: 215428
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.misc.

I agree with Collier Chun....Thicknet Ethernet cable may be fine on HF but I experienced losses that were twice as much as RG-8 when used at VHF and UHF frequencies.

Appearances can be decieving. Thicknet cable is very stiff, has 2 foil and 2 braided jackets. This quality makes the would be user think he's using low loss coax.

My advise: strip the jacket and use the braid to make HF dipole antennas.

>
> Thanks!
> Steve
>
>

A year or two ago there was an article in the Digital Journal about a PK232
and KAMplus comparison. The author found no noticable difference on HF
operation between the two.
I use a KAMplus and like the switched capacitance filters that can be set to
different mark space frequencies. The 232 uses fixed filters at 200hz shift.
Here again, probably no noticible difference. I work HF DX with it and have no
trouble copying weak stations, plus/minus conditions. I ground the DCD line
and set it foe external detect for best sensitivity on HF.
If you look at the mods database there are a lot of mods for the 232 and few
for the Kamplus. Maybe this means something?
The best thing about it is it is dual port so I can monitor the dx cluster and
work hf dx at the same time!

6142. REVEIW: ALINCO DX-70 HF FOLLOW UP

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-11 00:00:00 UTC
From: fitr%mimi@magic.itg.ti.com
Message-ID: <3tsqme$150@tilde.csc.ti.com>
Source record: 215434

Well, Thanks everyone who sent me a response to my original posting / review of the Alinco DX-70. I received several queries and questions from folks across the world so let me try to address them here. If you're question is not in this list, please resend via email and I'll try to respond. Since I dont like to publish personal email on a newsgroup, I've paraphrased the questions:

1. Ok...what are the filters like? Decent...

In terms of bandwidth, the filters are as follow. I've made a chart which should probably be included in the Alinco owners manual: (values are in KC)

mode wide narrow

SSB 2.4 1.0
CW 1.0 0.5
AM 9.0 2.4
FM * *

It is interesting to note that the standard CW Wide filter is only 1KC wide. It is a bit sharp if you are used to using your stock SSB filter when tuning CW. It took some adjustment, but, performance of the filters are quite good. I have no data on if these are true 8-pole filters, but, they do not exhibit any ringing or pinging and they are "solid" sounding.

2. CW Offset Adjustment: The CW offset is adjustable via a front panel software selectable option. 3 possible offsets are available: 650Hz, 750Hz, and 850Hz. The sidetone DOES change frequency as the offset is changed, which ensures an accurate zero beat. This feature is nice and even expensive rigs often omit this one. The sidetone is adjustable with the volume control, however, a base-line sidetone volume setting is set via an internal super tiny pot. This makes sidetone volue comfortable at your preferred listening level.

In addition, in CW mode, the user can manually select reception of CW using the "LSB or USB tuning". This is a nice feature if your narrow filters / if shift cant eliminate the interference. Just switch idebands

and possibly the interfering signal will reside outside the rx passband.

3. The tuning knob, while smaller than most HF rigs, has a solid feel. There is a torque adjustment screw just below and to the left of the tuning knob. In a bumpy mobile environment, you would likely tighten the screw to create some torque resistance against the tuning knob to keep things in place. Of course, there is also a dial-lock that locks the MAIN tuning dial. The SUB-Dial and the up/dwn mic buttons still work normally. The SUB-dial is actually a multi-function dial used to select ham-band, mHz step, 100KC step, or a mode-specific software defined frequency step. For example, my FM mode setting steps in 10KC increments. My SSB setting and CW setting step in 2.5 and 1 KC increments respectively. Though the tuning knob feels a little light, it is MUCH BETTER than any Uniden / Tandy 10-Mtr rig, and I find it even BETTER than the TS-50 tuning knob. While a little smaller in diameter than the TS-50, the Alinco protrudes from the front panel a little more and is easier to grasp without hitting other near-by buttons.

4. 6 Meter sensitivity is exceptional. In fact, the manual lists .15uV sensitivity in this band. There is no interference from near TV frequencies and I hear lots and lots of JA's during sporatic e openings. Unfortunately, there is no DUAL-BAND rx so you either listen to HF or to 6 meters, not both.

5. I tried the rig on 100 watts last night during a good band opening to Europe on 17 Meters. My signal reports were consistently good, Surprisingly, the rig got no warmer than it did during 50-watt operation. The internal fan coolded the rig as usual. I do find that the RF preamplifier (+10 db gain) is very helpful on the higher bands. There is a 10 or 20 db attenuator that does help on the low bands. I've not tired it on 80 or 160 so I dont know how AM BCI would effect it.

6. The circuit board is almost entirely surface mounted devices and you need a magnifying glass to read the circuit board, but, the board IS labeled with such items as VXO, RF PWR, S-METER, SIDETONE, ALC, IC, MIC GAIN, etc. So, adjustment should be a snap.

7. The manual is typical Japglish/Jinglish. I must have a pre-production manual since I found loads of humorous mis-uses of the english language. The manual includes some small diagrams of adjustment points in

the rig (for sidetone, mic gain, etc) but they are of very POOR reproduction quality. Better to just open the rig and hunt for it yourself. Also, there is a very detailed specifications page but NO SCHEMATIC. In fact, I recall my alinco HT did not include a schematic so this might be normal for Alinco.

8. Power cord is the same connection and polarity as the newer Yaesu rigs (890/990dc). However, the Alinco was smart--they use the 2 20-amp "blade/automotive" fuses (one in the + one in the - line). The kind that you would encounter on the road at a service station (no special trip to radio shack). Smart.

9. The rig includes a metal "bevel" to use in the shack to elevate the front of the rig. The SPEAKER is TOP mounted so you no longer get 2 watts of audio right into the transmission hump...smart again.

Well, that's about all the queries thus far. Please let me know if this has answered all your questions. Have a great day and hope to hear you on the air.

6143. ICOM 745 for sale

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-11 00:00:00 UTC
From: tomg@mail.ramlink.net
Message-ID: <3tsqmi$e3f@ram.ramlink.net>
Source record: 215435

I have an Icom 745 for sale. XCVR has both 500hz CW filters
and FM board for 10fm installed. Excellent condition, radio
is great for working packet and rtty using FSK which allows the
CW filter to work in the RTTY mode for great reception. If
interested - send EMAIL message back to me and I will advise
daytime phone number. IC745 is 160-10 meters with general
coverage receiver, dual vfo's and 10 memory channels.
Price: $725.00

I love it. I used to have an FT-470 and the intermod was a real
problem. I've taken the 530 through an area near Boston nicknamed
"intermod alley" and it performed great! I highly recommend it. If
you get one used (over a year old I'm told) there is an easy mod to
receive 800MHz. I bought mine when it first came out so it has this.

6147. ? VHF/UHF mobile transceivers of the future

Newsgroup: rec.radio.amateur.equipment

From: Dave Foster <dfoster@qntm.com>
Message-ID: <3tuo9e$dqv@worf.qntm.com>
Source record: 215439

I have recently purchased the Kenwood TH-79A 2m/440 HT. I'm very happy with it. I especially like the alpha-numeric capability, so memory channels can be given more meaningful names, among other usages. It's now time to purchase a mobile transceiver for the car. My shopping experience is that mobile transceivers don't have alpha-numeric capability. so my questions are: 1) Are there mobile rigs out there with that feature and 2) is there a reason WHY mobile's seem to be "behind"?

I'm guessing it is because more HT's are being sold, so all the design efforts are towards HT's.

Any thoughts?

Thanks,

Dave KE6MOM

I put a DSP-59 in-line with the speaker on my Kenwood TS-140S.

For an audio filter I'm very happy with it. I understand the DSP-100 filters the IF stages and probably does a better job. If you can't hear 'em you can't work 'em, but at what price?

Before you make a firm decision, check the HV on the tubes, the
Max allowable voltage for 811A's is 1500 volts, and it is 2750 volts
for the 572B's. If the plate voltage used is in the vicinity of
1200 volts (under load) you should be able to use the 811A's, if
it is much higher you will likely fry 811A's in a short time.
BTW, check the idle voltage as well and make certain that the max.
allowable voltage is not exceeded.

73,
Don W3FPR

I've been satisfied with the autotuner, but I haven't had experience
with any other autotuners. However, I've had my TS450S/AT for 2 years
now, and I wish that I would have gone without the autotuner and
bought a separate one that would tune 160m. The built in autotuner in
the TS450 does not function at 160m - only 10m - 80m.

I wouldn't say that you wasted you money. The 232 does have the one thing that the KAM lacks. Signal ID mode. It (the 232) will identify just about any signal that you will encounter on HF. I decided that it wasn't important to me. I was much more interested in the packet performance.

Different strokes for different folks.

Jim, N3JJA/Delaware

BTW, if you do get on 10m packet, look me up on 28.105 lsb.

From: Pat McGaughey <plm>
Message-ID: <3u1h8c$so8@newshost.lanl.gov>
Source record: 215302

I solved the problem of how to use a 145.19/144.59
repeater with my HTX 212 by enabling the MARS/CAP
mods as described in the owners manual. Then you need
to set the repeater offset manually as described
elsewhere in the manual.

By the way, the HTX-212 seems to work pretty well.
My main complaints include :
1. Poor return spring on the microphone.
I had to add some more adhesive backed foam
to reliably key-off.
2. No obvious way to store non-amateur frequencies
in the memories other than the VFO's. I've been
told by a Radio Shack technical rep. that there
are no mod's possible. I hope that one of you will
prove them wrong. We need this for search and
rescue work.

Is your 20W amp for 2M only? If so, they typically will not present a proper load for 440Mhz
(even in pass through mode). Try taking the amp completely out of the circuit in the car.

k9un
==========Jonathan Schulman, 7/8/95==========

I had a posted a message before about being able to receive 440Mhz repeaters, but not able to trigger any of them. I went over to the local Radio Shack, and confirmed that I am able to transmit on the 440 as the RS scanner picked it up without a problem. The repeaters have no listed PL tones, the offset is correct, and the direction of it (+, -) is correct as well. This problem occurs both with the standard 1.6w battery pack, and my 20w amp in my car. Any suggestions?

Thanks.

Run an antenna outside, and connect it to an antenna inside.

Some hospitals do this and have the antennas tuned to the frequencies
used for pagers, so people inside the hospital can be paged.

Message-ID: <1995Jul12.165713.1915@lmpsbbs.comm.mot.com>
Source record: 215306

I'm taking off on a 2 week drive cross country through some
relatively remote areas in the southwest and rockies. I'd like
to take along a radio for "just-in-case" use and to also to pass the
time. The only mobile/portable radios I now own is a 440 FM HT
and a 10m all mode mobile. Besides going to the expense of buying
a new HF mobile rig and antenna I was wondering what folks on the newgroup
thought the best choice was. A 2m FM mobile might work in more populated
areas (no idea what repeater coverage in the area looks like now). The
10m mobile wouldn't cost anything, but openings are very sporatic, but
at least they are better than line of site. An HT would seem to be pretty
useless. Any suggestions?

The areas I'll be passing through are Death Valley CA, Joshua Tree National
Park, east to the Grand Canyon, Silverton Colorado then east to Chicago,

Thanks!,
Mark Lakomski
WB9PPL

My opinions, not Motorola's.

> 738 with some software differences.

No, the 736 and 738 are twins and share very little with the 737. Grab Icom's brochures and look at the radios pictured with the covers off, there is no simularity inside whatsoever between a 736 and 737.

Maybe they used similar electrical designs, but the radios are completely different mechanically. I find it hard to believe Icom would bother to change the mechanical layout, put it in the same cabinet, and use the same electronic design. I mean, why bother?

Isn't that lame, ed? You'd think that a radio "designed by hams for hams",
as I've seen written, would be capable of using the entire 2 meter band right
out of the box. OK. So maybe you don't really need 144.0 - 144.1 on a
FM radio... But still!

You have to do the keyboard mod to "open it up" for MARS/CAP. Funny that one
should have to "modify" his radio in order to use it in the band it was
"designed" for...

I don't have the info for you, but I believe it is in the manual...

From the trips I have taken, crossing the path you outline, you should
have no trouble with an HT and car top antenna (2-meter), or Mobile.
The 70cm gets a little sparse through northern Az but isn't bad.
Into southern Co tho, I don't know.
Most of your route has been targeted by ham repeaters for the road
problems. A 2m scanner might also be wise choice.

As long as the 900 MHz phone uses spread spectrum...I can monitor Sony
900 MHz cordless phones quite easily on several of my scanners...I
have a Sony and decided to try and map it's frequencies, but gave up
for the time being...too much intermod and bleed-through from cellular
on my unmodified BC890XLT...gonna have to set up one of the 2004's or
the 2006's and play with the phone one evening...

I just wanted to
>know if there are still call signs left in the
ADVANCED pool ?

Buddy, Area six does have advanced (also known
as 2-by-2) callsigns left, but, you'd have to upgrade
to advanced class to receive the preferential (aka
shorter) callsign. I think they are somewhere in the
KQ6?? range but dont remember off-hand.

This may change with the new VANITY callsign program,
but I dont know if a tech or no-code tech will be able
to request a 2-by-2 or a 1-by-2 or a 2-by-1 callsign.
Perhaps someone in the USA has more recent information
on the vanity program and could advise both of us.

73 and good luck in getting your upgrade

>Dave KE6MOM
>dfoster@qntm.com

I believe the Yaesu FT-2400 and 2500 mobile 2 meter
rigs do include this option, as does the new Icom
IC-2000 transceiver. Other rigs do not have the
alpha-numberic display per se, but do allow a
channel-only option (turns the freq readout off and
only displays the channel number). Probably this
feature is for business-band use (outside the USA)
where ham equipment is almost always used for
commercial applications.

Discussing this with a buddy of mine (works for
Yaesu-Musen, Japan) he revealed that most beginners go
out and buy an HT and this "addition" is really
designed for the beginners. More "experienced" users,
he claimed, did not really need the alpha-numeric

feature any more as they had "memorized" the
rpt/simplex frequencies.

I disagreed since many newer ht's cover police, fire,
etc. It's handy to store the public service city or
service name in this alpha displays.

Check out the newest mobiles---you'll see the alpha
dispalys are becoming more and more popular.

>IN This Confrence As I'm Using My GirlFriends Account and want to keep her
>out of this.

As far as I can tell, the majority of a radio fingerprint is determined
by the technology used to generate the transmit frequency. To a lesser
extent, noise may modulate the transmitted signal in a unique way, also.

From limited experience, it seems that crystal controlled radios tend
to "chirp" onto frequency during transmission. By chirp I mean that the
transmitted frequency starts at one value and rapidly drifts in a monotonic
manner to another frequency where it remains fairly stable. I suspect
you have a PLL synthesized radio, though.

PLL synthesized radios tend to bounce onto frequency. The bounce
is essentially determined by the PLL parameters, and looks like a
damped oscillation (well, it is actually a damped oscillation).
This bounce is usually referred to as the "step response" or
"overshoot".

My TR-2600A HT always bugged me about the way it seemed to generate a
spike on adjacent channels on keyup; a look at the transmit signature
confirmed it has a very notable PLL overshoot with little damping.
I eventually worked the PLL parameters and found the loop has a
damping factor around .3 (it should be more like .7 to 1.0). It turned
out that it was too much work to modify the PLL loop filter to
significantly alter the step response.

However, depending on the radio, you may be able to modify the
loop filter to gain a different step response. Keep in mind,
there are a number of factors involved in PLL design, and if you
don't balance them carefully, you can end up with a radio that
won't lock up on transmit, generates illegal spurious outputs,
won't transmit PL tones correctly, takes a long time to lock
up on transmit, or has some other problem.

It is really best to go study PLL synthesis (if you haven't
already) before trying the kind of experiment I'm suggesting,
and it simply may not be practical in your case if your
radio is a tiny, surface mount marvel.

What? A person has to give a callsign to ask technical question? Since
when? A little paranoid there. Afterall, though every radio is said
to have different fingerprint, a particular model of radio is
probably going to have a very similar fingerprint in most units.
The fingerprint isn't some random thing; it is determined mostly
by the components and component tolerances in the radio, and less
so by the operating conditions of the radio. I could easily see
how a jammer using a TH-78 could cause a bunch of nice people
using TH-78s to want to change their radio fingerprint :-).

I've already posted a note regarding how a radio fingerprint is
developed and how it can be changed. Frankly, if someone learns
enough to modify a PLL synthesizer correctly, I'd be pleased.
I tend to believe amateur radio would be better off if there was
more teaching and less paranoia and complaining.

>>Dave KE6MOM
>>dfoster@qntm.com

Dave, not to answer your question (that's already been answered in another post), but on a similar topic, you observe that mobiles seem to be "behind". I agree with you. Here's an example: I bought an Icom W2A about 3.5 years ago. I thought it was pretty neat that it had CTCSS encode/decode standard, paging, code and tone squelch, DTMF memories, basically all the bells and whistles I would ever want (few of which I have actually used, though :-)). When I started looking for a mobile rig, I was kind of shocked. Only the more expensive rigs have CTCSS decode built in (on the other ones it's an option), ditto for code and tone squelch, paging, and all those other goodies. I have only come up with a couple reasons:

1. As you say, most new hams buy HT's. Development always goes where the money is.

2. The features are offered as options, so the radio looks cheaper.

3. A combination of the two.

Anybody else notice this?

BTW, I don't consider Alphanumeric displays that great a feature. The only thing I can see as being helpful would be to put the location of the repeater as the display, but this is really only necessary when you're new to an area. Once you use the repeaters a few times, you'll pretty much remember where they are and where you can reach them from by looking at the frequency. And I think the "channel" option on some is even worse.

Anybody agree with me, or is everyone in this group a born-again alphanumeric-lover? :-)

But most importantly, do what works for you.

73,
Russ "I'll stick to numbers" Roslewski KI7FL

Oh great! Another one inventing intents and suspicions in some's post.
It's quite simple Dana, I'm the control operator for 3 mountain top
repeaters. We have jammer troubles, very nasty ones. False 911 calls,
dropping the phone patch during 911 calls, plus all the usual nonesense
that jammers do. Paranoia? No way! Experience! And whether people care to
believe it or not, sophisticated equipment and software can positively
identify one transmitter from another. Same make, same model, 1 serial
number apart - no problem. Other than paying for such gear!
Chris, N7RME

Hi George--I have had the experience of trying both the Chinese tubes (while living and working in Japan) and Russian tubes (while studying in Slovenia, Yugoslavia back in 1988). I have the following general comments, since I was using 3-500Z's and not specifically the 811A's.

Russian tubes will likely be more expensive than the chinese tubes. However, after the collapse of the former Soviet empire and free market reforms, many of the lesser-known Soviet tube makers went out of business. There are only a handful of new tube manufacturers over there today. I say this because the chances are good that you will not be purchasing "new" stock tubes. By this, I mean that the tubes are "new" (unused) but are "old" because they were made 10 or more years ago. Some guys only want "new" "new" tubes. If this is the case, go with the Chinese tubes. They are almost all new production and new tubes.

In terms of service life, the Russian tubes outlasted the Chinese tubes in both the Heathkit SB-220 and the Drake L4-B amplifiers. I believe the Russian tubes are of higher/better workmanship and quality as compared to the Chinese tubes. (IMHO).

Good luck. I believe RF-Parts in California is handling the Russian tubes these days. My source for Chinese tubes was T-Zone in Tokyo, Japan.

73 and good luck. de Joe BV/N0IAT in Taipei, Taiwan

During the last shuttle mission NASA select audio was rebroadcast on the 145.29 repeater.

Also, the ATV folks had live video most of the time on their Shaw Butte repeater. The output
freq is equivalent to cable channel 57 and can be seen on a cable-ready TV with a decent outdoor antenna pointed at the mountain.

Actually a Kenwood 28A will operate on 2meters and receive the 430-470 stuff. CB 27 mhz is HF and wont be receivable on a HAM ht *maybe one of the older Icoms but I doubt it. Transmit is a diffinite no! Two reasons 1 CB's have to be type accepted so using a HAM unit even an HF unit is not leagal. 2. CB is AM and HT's are FM. They can recieve Air band 116 MHZ (VHF) AM but wont transmit AM VHF and certainly not HF (AM OR FM) I don't know of any HF ht's. You would think that a 10 meter would be no big deal.

The Advanced calls are at about KO6??, soon to be KP6??, so there are still
2x2 calls left. That is apparently as short as you can get as the Extra calls
have gone to AC6??, which are also 2x2's. I imagine the only way you could
get a shorter call is by requsting a vanity call when those are available.

>73 - Dave.
>

The series of articles in QST last year by Ulrich Rhode were clear as to the performance improvement yielded by replacing the standard PN junction diodes used to switch bandpass recieve filters and others in the signal path before the first mixer with PIN diodes. Specific PIN diode types were evaluated by Rhode and others as to improvement in 2nd and 3rd order IMD performance.

The effects of replacing diodes in the signal path behind the first mixer, including the IF filter switching diodes was not evaluated -- it would be interesting if someone knowledgable would do it and document the results.

I have replaced the 1SS53 diodes used by Icom in my 781 for RF and 9MHz IF filter switching. I used the H-P 5082-3081 PIN diode used by Rhode in his early tests. Without a lab to measure the results, the best I can tell you is that performance appears to be AT LEAST AS GOOD as it was before the modification.

I did not replace the 455KHz filter switching diodes - primarily because the fact that the low frequency limit of the 5082-3081 is about 250KHz give or take and I saw no clearly documented benefit of trying it (and I was one diode short of having enough -- darn!). As it was, I replaced a total of 43 diodes -- tedious and not for the faint of heart.

I did this work myself, so I can't vouch for the work done by Bill Rohrbach.

Hallicrafters merged with the Northrop Corporation in December, 1966.
They were acquired by the Breaker Corporation of Arlington, Texas in
1975 which marked the demise of the 42 year old name of
Hallicrafters...

The last years of Hallicrafters production, under the Northrop wing,
saw the introduction of very few pieces of ham gear and a general
decline in amateur radio related marketing by this group. The SR-400
and SR-400A Cyclone and Cyclone III transceivers, the HA-20 remote VFO
for the SR-400 and the SR-2000 Hurricane (which came out in 1965),
the SX-133 receiver, the SX-122A receiver, the FPM-300, and the
FPM-300 Mark II Safari, were the last products designed and delivered
by Hallicrafters under the Northrop wing.

According to Hallicrafters historian Max De Hensler, a firm called the
Hallicrafters Company marketed a 2meter system consisting of H2M-500
and H2M-1000 transceivers, two RF power amplifiers models PA-120 and
PA-250, and four antennas, models HA-700, -800, -900 and -985.
This company was located at 2501 Arkansas Lane, Grand Prarie, Texas.
These units were marketed in late 1977 and nothing was ever heard
frrom Hallicrafters again.

BTW, Johnson didn't fold, they are still in business today, they just abandoned the ham and CB markets and concentrated on business radio systems, etc., and specialty connectors....I occasionally see pieces of Johnson 800 mHz equipment around...

Drake also never folded, they got into the Satellite TV scene in the early days and commanded a good share of the market with their equipment there. Their new R-8 (and I presume it's new variant, the R-8A) are great general coverage SW receivers...I like the audio out of that receiver better than the audio out of my FT-990, OMNI-V, R-71A, or TR-7 by a big shot (I wont mention the myriad of tube receivers that I also use, I just want to compare solid state with solid state)....

Drake still services all their ham gear, some parts are getting scarce and the final tubes are hard to find, but, they still have factory service available...

Had a 580 (now a kenwood 78). 580 had to be turned off to go from dual to single band. Could not do tone SQ on two bands at once. Lables rubb off keypad. Had intermittant problem with PTT switch. Less sensitive receive then Kenwood. On the up side 580 had good sounding Audio. Is sensitive enough to pick up anybody that can receive it. Easier to use then Kenwood (dont need manual to operate). keypad is large enough to use. Still like the kenwood better but the 580 was much less expensive.

6191. Kenwood BT-9 pack - No NiCd's?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-12 00:00:00 UTC
From: llee@gomez.sanders.lockheed.com
Message-ID: <LLEE.95Jul12105925@gomez.sanders.lockheed.com>
Source record: 215369
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I recently bought a Kenwood BT-9 AA-battery adaptor (it holds 4
standard AA cells and plugs in like the normal nicad pack for the TH22AT).
The TH22AT manual and the BT-9 have a warning:

"Installing NiCd batteries in the battery case will cause an
electrical short that generates heat and damages either the battery
case or the transceiver"

I'm wondering how is this possible? Also, does anyone know if charging a
NiCd equipped BT-9 pack is OK using the radio's internal charger?

I checked the schematic and the TH22AT internal charger uses an
(emitter follower) constant current source set to about 50 mA.

Thanks!

The reception from a scanner with a quarter wave 70cm antenna (simple wire on a BNC) for 900MHz phones is much better than 46/49 phones with an appropriate antenna.. :)

I was actually amazed to hear people all over the place, at one time 11 conversations from 902 to 908 or so.. And this is in a lower middle class neighborhood, no super rich people around here...

Apparently just super-poor-because-they-like-neat-toys, like me.. :)

The Uniden 9100 rulz... Slight echo, but it's almost amusing.. Now if it had a LARGE echo delay it'd drive me nuts, but it doesn't bother me at all..

I didn't invent your words, which were:
Uh, mebbe' you could tell us more? Like who are you? Who is identifying you
as a jammer? Whats yer call? You can't really expect help from such little
info.

>It's quite simple Dana, I'm the control operator for 3 mountain top

>believe it or not, sophisticated equipment and software can positively
>identify one transmitter from another. Same make, same model, 1 serial
>number apart - no problem. Other than paying for such gear!

Maybe you've got your reasons, but I don't believe this changes the
fact that your note which expresses suspicion and paranoia about
the original poster. I know that operating a repeater can
be very frustrating, but automatically mistrusting any amateur

that breathes the word jammer and demandind indentification and a
callsign is simple paranoia in my book.

Also, I think your faith in radio fingerprinting is misplaced.
Indeed, the component variation from one radio to the next may
make it such that two identical models of a radio one serial
number apart may have slightly different fingerprints, but this
is not a given or a positive. As with other kinds of fingerprinting,
there's a range of certainty, and using words like "positively"
as if radio fingerprinting *always* can tell one radio from
another is misleading. I'm not saying that radio fingerprinting
isn't a powerful tool, I'm simply trying to point out that
radio fingerprints are not some random fluke of nature and
it is false to assume all radios have uniqe fingerprints.

In fact, I'd go so far as to say that someone using transmitter
fingerprinting should be familiar with how PLL synthesizers work.
For example, the fingerprint of a radio is probably different at
one end of the tuning range than the other end (VCO gain changes,
and that changes the step response). In other words, fingerprinting
a radio at 144.78 MHz may give a very different picture than at
147.99 MHz... and so on.

>dB of attenuation at HF. Thick metal plates look really attractive
>when making UHF amplifier ventilation holes.
>
>How much attenuation do you estimate?

7.7 dB is so much at variance from experience that something is
missing from this calculation.

First, we can model the hole as a circular waveguide operating in
the TE 1,1 mode. The cutoff wavelength, Wc, will be Wc=3.412*a
where a is the diameter of the hole, or Wc=0.0054 meters. Now we
can choose 30 meters, W, as representing the middle of the HF spectrum,
and d is the thickness of the sheet metal, 0.00038 meters, so attenuation,
A, is

A=54.5*d/Wc*(1-(Wc/W)^2)^.5 = 3.845 dB

So, the hole doesn't have much attenuation as a waveguide beyond
cutoff. Yet we know that perforated metal offers good shielding at
HF, so something is being overlooked. What is being overlooked is
that the waveguide isn't being matched perfectly. In fact, only
Wc^2/W^2 of the power of the wave is being coupled to the hole,
and that's 10*log(Wc^2/W^2) or -74.89 dB. So the power escaping
the hole is -78.74 dB down from the power of the signal presented
to the sheet metal with the hole in it.

Dana -

>simple paranoia

I'm afraid I have to take Chris's side on this - no paranoia,
just normal cautions. I avoided responding to the original post
because it sounded like flamebait (if it was, it seems
moderately successful!).

Take a look at the "evidence": no name or call, (apparent)
surrepticious use of someone else's account, doesn't know (or
care about) the correct spelling of "radio", and is requesting
information about circumventing detection by a tool employed to
screen unwanted activities. If this was a ham trying to solve a
legit problem, we would likely have more to go on, including
some indication of literacy about the hobby. IOW, the post just
had "bad vibes".

I liked your original posting (now gone, for some reason), which
delved quite deeply into the theory without getting too close to
the "how to" details. But IMO, your re-posting treads on thin
ice by alleging that transmitter "fingerprinting" is not as good
as this person was led to believe it is. As somebody who uses
fingerprinting as an evidence-gathering technique, yes, it may
not be perfect, but it still is very good, and I would prefer
that the original poster remain (correctly) fearful of the
efficacy of the technique.

>I could easily see how a jammer using a TH-78 could cause a >bunch of nice people using
TH-78s to want to change their
>radio fingerprint :-).

This puzzles me. On one hand you eloquently explain the PLL's role in start-up transient
characteristics, then turn around and imply=
that radios of the same make and model will have the same or similar fingerprints. Not
true. What *is* true is that there will be c=
ertain "characteristics" of a design (Alinco HT's, for instance, "bounce" on startup), but
each radio will still have a unique curve=
on key-up.

Anyway, there are apparently several here who had the "Who's this?" reaction to the post,
and were equally and justifiably reluctant=
to yield details.

>front ends, etc, so, using PL was an added means of
>preventing random intermod induced transmissions.

Actually, many of the older GE Mastrs and Motorola Micors
and such had *excellent* helical filtering. Most of the
intermod problems stem from *external* mixes at the site,
usually in other *transmitters*. Use of ferrite circulators
on the offending transmitters can help a lot, but that
unfortunately means modifying *other* people's equipment,
and that's often not feasible. You can also often get
mixes from rusty hardware on the tower, so CTCSS has
become the main line of defense against false keying
of UHF repeaters at high RF sites.

Oh, and BTW, it's *ham*, not HAM. It's not an acronym.

The standard workaround at VHF/UHF is the Ventenna, which is just a
VHF/UHF vertical tucked inside a piece of PVC pipe that slips over
a roof vent and extends it. The antenna isn't "outside", so it meets
the covenant restriction.

>Here are my questions:
>
>1: What is the easiest way to learn Morse Code

There is no easy way. Grind, grind, grind, drill, drill, drill, is the only way to condition the wetware into emulating a modem. Computer trainer programs like Supermorse can help with the drill, tapes are too easily memorized. Work with 5 letter random groups, *don't think*, just do. You have to make copy a reflex action. When you hear the sound, the finger has to be in motion striking the proper key. You have to completely divorce your conscious mind from the process.

>2: What is the busiest meter?

Simpson 260.

>3: Is the TS-140S a good HF rig for starters?

Not the best, not the worst. Too much money for a starter rig, though, unless you find a deal. A TS-520 is a better starter rig.

I have a Alinco DJ-F1T (2 meter HT) which is in need of service.
I purchased the radio used, and the manual received with it has an
apparently old address and phone number. Could some kind soul
provide me with a phone number or address for Alinco here in the
states?

Thanks much,

Kevin

The statements/opinions expressed here are not necessarily those of the
Hewlett-Packard Company. HP paid a research firm millions of dollars to

The Hallicrafters company lasted until the mid to late sixties,they stopped
building consumer electronic equipment to concentrate on the space race to the
moon. They were bought by the defense giant Northrop.
I have heard rumours that they are still around in some capacity building
electronic equipment for industry.
The founder of the company died a couple of years ago, he was well into his 80
s or 90s but he was quite an active Ham.

From: wa8msf@aol.com
Message-ID: <3u1a69$ek3@newsbf02.news.aol.com>
Source record: 215390

Hi Peter!

I recently purchased an FT-900 (not AT) and the SSB filter. I used it on my 75 meter horiz-loop and the AEA iso-loop @ 110'. The crowd on 3849.5 told me I sounded so-so with the ceramic filter and on 20 meters I received NO compliments on the audio no matter how much I screwed around with the transmit passband-shift processor.

After I installed the SSB crystal filter, the 3849.5 guys said it sounded great on transmit and when I dialed in 270 Hz of Low-cut with the processor, they said that it sounded like a good imitaion of a Heil microphone.

The receive audio also sounds better, but the main reason to buy it is so you can receive unsolicited compliments on your transmit audio from random guys on 17 & 20.

Cheers.

Mike - WA8MSF@aol.com

Well, thanks to divestiture and such, 800 number information
is not universal. Each carrier (AT&T, Sprint, MCI) provides
listings of their subscribers, for an additional fee.
Many 800 numbers are therefore unlisted!

6226. Standard C188/288/488 Help

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-13 00:00:00 UTC
From: andy@clark.net
Message-ID: <3u483e$fqv@clarknet.clark.net>
Source record: 215204

If you have one of the above Standard thin monobanders, to you happen to know the answer to either or both of the following questions?

1. Besides the 3 screws on the rear panel, what else has to be removed to get inside the radio. I'm afraid to apply any more pressure than I have been to remove the rear cover.

2. What pot do I need to look for to adjust the deviation, or the output of the DMTF encoder?

I'm not getting in to the autopatch because (I think) the tones are too loud. I think the unit is over-deviating.

Thanks for any assistance

andy/k4adl

The old Icom IC-2AT has a ham-band only receiver. The FT-51R, like
most modern toys^H^H^H^H HT's, has a wide-open front end to allow you
to listen to the police, etc.

There are several ways to fix this: 1) don't use an external antenna (this
is only a partial fix), 2) reduce the gain of the receiver (another
partial fix), or 3) connect a filter between the rig and the antenna
that rejects the undesired frequencies.

>wb2cpa 508-960-6119.

Many rigs have reverse polarity protection diodes directly across the power leads, whose purpose is to blow the fuse immediately when the rig is powered wrongly. Check that to see if it's still good.

Also, there could be an electrolytic filter cap near the voltage regulator that takes your 12 Vdc down to a lower level of dc. Bad polarity might have blown that out.

And then there's the RF power module, as Zack says. Those run ~$50. Hope that's not the trouble!

6229. MFJ Memory Keyer Problems

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-13 00:00:00 UTC
From: ddepew@cmt.chm.tec.sc.us
Message-ID: <1995Jul13.165005@chm.tec.sc.us>
Source record: 215207

I've had problems with a brand new MFJ memory keyer 492X. It loses the info I store in the memories when I power down. The lithium battery is fine. And it's an intermittent problem. MFJ has agreed to swap it, but it's aggravating, and I wondered if anyone else out there has had similar problems with the unit.

Thanks.

Email responses appreciated.

6230. ICOM Rptr Info needed

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-13 00:00:00 UTC
From: "Alan K. Adamson" <ne1h>
Message-ID: <3u48hq$i6r@wa4mei.radio.org>
Source record: 215316
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

All,

I may have access to an ICOM Rptr that I would want to sell. It is a model IC-RP3010, the one with the gold front panel. I don't have any more information
about it except there are additional crystals, it is in good working order and the ID programming information is available. I don't know about duplexors, etc.

What I do need to know is approx. (don't insult me) asking price. What is this thing worth on the used market. (I know , as much as I can get out of it)

I don't even know where to start.

Any suggestions or comments.

Thanks, and post and email to this group and address listed below

Source record: 215319

I have not used either of these, but I have done a lot of mobile HF and have owned both the Yaesu 890 and the Kenwood TS50. I have had two of the Kenwoods. I would prefer the TS 50 over the 890 because of size, audio quality, and asthetics. The 890 is nice too, but is more at home on a desk, and not in a car.
My HF mobile is a ford Mustang, mayby you have a Suburban and dont care, but, room is at a premium for me. BTW, the Yaesu 890 has the internal tuner, keyer, and more buttons on the front for quick access to the controls. The TS50 has no keyer, no internal tuner, but most of the controls are accessable through a menu type system. I like the TS 50 Get one used for about. $800.00
You may also want to look at the new Icom 706. Small like the TS50, but 160 through 6 meters and 100w!. Also 2 meter xmit and receive, and 10 watts out on TX. I dont know what the price is going to be.

P.S. I have heard rumors about noise interference with the Yaesu 900 when using it with the front panel remote from the main unit.

: wb2cpa 508-960-6119.

The output RF power module is a possibility. Rather than use a
big switch that handles many amps, it isn't unusual to wire
the power directly to the module. It might be easy to unsolder the
power to the output module.

6236. quick-release harness for mobile rigs ??

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-13 00:00:00 UTC
From: sheppard@ruby.decatl.UUCP
Message-ID: <SHEPPARD.95Jul13101935@ruby.decatl.UUCP>
Source record: 215322
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

Can anyone point me to:
(1) a commercially made product
or (2) useful homebrew hints
for a quick-disconnect harness for a mobile 2M or dual-band rig ?
(The rig in question is a Yaesu FT-2400).

I remember hearing of such a beast once but don't remember the source.

My intention is to ease the transfer of the rig between two vehicles
and a fixed base station. I envision identical pre-wired docking bays
permanently installed at each location to provide power, ground,
antenna (and control ?) connections, and a corresponding low-profile
harness permanently mounted on the rig itself.
Mods to the rig are probably inevitable (sigh).

The prime issue here is speed and ease of connect/disconnect, not security.

Thanks in advance for any pointers, information or suggestions !

From: Marcel Mary <mma@infoboard.be>
Message-ID: <3u3aia$lhj@ibbr.ib.be>
Source record: 215327

Hello everybody,

I would like to improve my receive. I have 300 feet of coaxial cable
between my beam and my radio. If I use a receive RX amplifier as close
to the radio, I think it will not do a lot.
I think it should be better having this amplifier as close as possible to
the antenna. There is only one problem. When I'd make a home made RX
amplifier it will not resist the TX power and blow immediately, so
I need one that reroutes the line over the amplifier so I can't blow it.

Does such amplifiers exist?? Commercial ones???

Please send me information to Kurt.vlaminck@infoboard.Be

I have only here full internet access (from my work). At home I only have
an email add. So please send mail only to my email add
Kurt.vlaminck@infoboard.Be

I've heard folks say that the 12v packs don't work well. I don't know
from experience. I DO HAVE the BP8 clone from Periphex and it works
fine (almost 9v) except when using the rubber duck. If I use the
rubber duck with it, the radio gets ER2 codes once in a while.

If the wavelength is short, then a waveguide is a wonderful substitute for
a transmission. HOWEVER, when the wavelenght is increased so that
a half-wavelength is longer than the widest dimension of the
waveguide, the signal will no longer propogate. (The exact formula
for the cut off frequency depends on whether it is round, rectangular
or whatever.) The characteristic impedance of a waveguide beyond
cut-off is reactive, unlike 50 ohm resistive we are used to in coax.
This makes it difficult to make a match!

73, Paul

I own an FT51R also. The only thing I've found to be of help is using
the PL decode feature whenever possible. Of course, many repeaters
do not pass the tone thru, so it's of limited use.

One mobile unit that may be able to give you alphanumeric displays with each memory channel is the new Yaesu FT8500 dual bander. This the unit you may have spotted in Yaesu's inside back cover ad in the July QST, featuring the big orange LCD display, builtin 9600 baud capability and a microphone loaded with more buttons, knobs and deelybobbers than a 747 cockpit. I'm told it's not yet actually in the retail channel yet, but that its street price should be around $670.

The ads do point out the 6-character alphanumeric display but don't say whether the text is fixed (e.g., just built-in menus, etc.) or user-definable. Also, no mention is made whether there might be any computer control i/f so you might set up the memories and text associated with each from, say, a Windows program as they've just shown in their new August QST ad for the FT51R HT.

Regards,

6253. Radio Shack HTX-202 Battery Specifications...

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-13 00:00:00 UTC
From: dpbaker@lilly.com
Message-ID: <1995Jul13.130715.5476@inet.d48.lilly.com>
Source record: 215339

I have a friend that needs to purchase a replacement battery for this Radio Shack radio. Does anyone have the specifications on the original battery pack that came with the radio? I realize that it's equivalent to some ICOM BP- series pack. If you happen to know the W & W Associates number, that would be great too.

>just the price you pay to be able to snoop on the cops and the
>fire dept.
>
>If you want a toy, buy a Icom/Yaesu/Kenwood rig; if you want a
>communications tool, buy Motorola.

Although I don't wholely agree with Jerry's accessment of Icom/Yaesu/Kenwood
the core of what he is bringing across is true. The quality of commercial
equipment surpasses what you will find in the amateur market. BUT! This
does not answer mparkes@aol.com question (because mparkes asked for a
handheld dual band radio, which Motorola doesn't make... unless there is
something in the commercial market I am unaware of - which is possible...)

In the past I've owned a Kenwood TH-77A and presently own a Yaesu FT-530
I must say that both radios are very good. I must also qualify that I've
only had the 530 for about 3 days now, but so far I've been very satisfied
with it's performance. I only have two minor gripes about the 530 of
which I didn't have problems with when I had my 77.

1) Direct random access to the frequencies stored in memory
2) Minor bleeps of occasional intermod in some areas I didn't have
problems with in my 77 on the UHF side.

Please cover your eyes if you are faint of heart on this next part.

3) Out of band transmit on my 77 was better than the 530

Okay you can open your eyes now...

But the advantages the 530 has over my 77 outweighs the gripes by far.
1) Good out of band receive (observed up to 484Mhz - haven't tried
something higher yet)
2) 40 Independant memories for EACH band (more than the 40 memories total
for the whole radio on my 77 and the memories were NOT independant)

My bit of advice to you is ask other hams that live in the community you
do. See how they like the radio they own. See if you can borrow a

radio and try it out for a couple of days (this is harder to do). This will ultimately determine if the radio is right for YOU. Because each area is different in the amount of interference you will be exposed to and should eliminate most of the bias you may come across.

Final note: I've heard some complaints about the 530's dinky speaker. The 77's was actually worse, but in the Kenwood 78 it was improved and is better than the 530... if you want a review of the 78 someone else will have to give it to you because I don't know enough about it other than some have had major problems with intermod on the VHF side.

I also own a Yaesu FT-530 and it is useful for what I use it for: armchair monitoring in my living room when I'm not in earshot of the base rig upstairs. I certainly wouldn't subject the FT-530 to the treatment my Motorola rigs typically get.

Here's a list of my likes and dislikes about the FT-530:

Likes:

1) Good form-factor. Easy to hold.
2) Battery voltage display (the clock is useless to me since I use this rig in the living room and have three clocks easily visable).
3) Nice display.

Dislikes:

1) This thing gets hammered by intermod from the massive array of paging transmitters, land-mobile, TV, and radio transmitters just five miles away.
2) Durability, lack thereof.
3) Poor audio quality. What else can you expect from such a tiny speaker? My Motorola HT's have better audio than some mobile rigs I've used.
4) The battery attachment mechanism seems weak.

Easy, there ole fella. My original post said NOTHING
about Motorola equipment or GE equipment lacking
helical filtering. It said that some older equipment
used in the ham service lacked the

filtering that is found on commercial
gear. Using the name PL or CG is simply the trademark
name held by Motorola and GE respectively on their
CTCSS squelch systems. Also the term "ham" has NEVER
been proven to NOT be an acronym. If you can prove
it, I'd like to hear about it.

>My opinions are my own, not my employer's.

Rockwell bought Collins Radio Company in 1971, i believe. Some product lines still carry the Collins name (such as Avionics and some Telecommunications products) while newer product lines coming out of what was Collins Radio definitely have a Rockwell name plate (e. g. Land Transportation Electronics). See the new logo for an example of how the brand names are handled now (Allen Bradley, Collins, Reliance Electric, Rocketdyne, Goss, etc.) as a subhead under Rockwell.

Drake is still with us, recently back into the shortwave receiver biz after an absence into satellite tv and such. Maybe someday a transceiver again...

E. F. Johnson is still with us -- see a Digi-Key catalog for an example of their component wares..and they were into 2-way radio when i last checked (for those that can't afford Motorola or Ericsson/GE...8)).

didn't someone post something about the final liquidation of the National Company a couple of years ago? what surprised me was that it was recent..

Hallicrafters was acquired by Northrop (now Northrop-Grumman...although the logo suggests they tried to cross out the name Grumman and missed...8) so a local former Grumman employee told me...) and i think the FPM-300 was the last radio -- sort of a FT-101 clone, if i recall. not a spectacular radio but it was usuable (used one at a field day for a while...).

: TDanko1056@aol.com

You mention you want to upgrade so I assume your a ham already or
maybe you meant you want to get your amateur radio license.
IF your a ham already get on the local repeaters and just ask! No doubt
someone will be glad to let you know the answer. If you have a scanner
scan the 2 meter band (144.000-148.00) and listen in a while. Some radio
clubs have on the air meetings once a week and you may hear a phone
number of a local ham and be able to give them a call and kindly ask if
they know where and when the tests are coming up. You might want to post
the city you live in and maybe someone nearby can help you a little
better. Your on AOL so send a mail message to arrlhq and ask if they can
help. Check the HAM RADIO area on AOL also! They'll give you a list of local
clubs and folks in your area to call, jeez I just thought about that!

Well I would advise you to remove the NiCd AA and charge them in
something else. I've used NiCd for my TH-77AT and have had no problems.
Just charge them outside the case.

>I checked the schematic and the TH22AT internal charger uses an
>(emitter follower) constant current source set to about 50 mA.

That may be so, but you may find that it will be difficult to try attaching
the case of the BT-9 to the stock charger supplied with the radio. The
mechanisms are slightly different. Take my advice and charge the AA in
something else.

6271. REVIEW : Alinco DX-70 HF - n0iat.rv [1/1]

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-14 00:00:00 UTC
From: clinton.peebles@saloon.bcbbs.net
Message-ID: <9507140703574935@saloon.bcbbs.net>
Source record: 215214

F>a. SWR meter built-in to monitor the mobile SWR b. Alinco sells the mobile
F>bracket as an option. AT 20+bucks, I'm gonna make my own. I paid about
F>$1100 but I have the 70 (the 70T has the ctcss encoder). This should give an
F>idea of the US price. Queries welcome. Thanks for reading, and 73.

I was thinking of getting one of those little toys, but looking in a
magazine I got yesterday, Icom has come out with one, IC-706, that
includes 2 meters. They say it's the world's smallest, but knowing
ICOM, it will also be the most expensive. I wonder what Kenwood and
Yaesu will come out with..

QMPro 1.53 I believe in The Divine Right of SysOps.

I've used a pair of BP7's on my 202 regularly for about a year now,
and have yet to experience any problems. I've also regularly operated
the 202 with 13.8 volts external power, and again have yet to have any
problems. The last time I measured the output power while using a
BP7 it was around 7.5 - 8 watts.

Keep in mind though that with this, as with most everything else in
life, your mileage may vary...

: --
Dan:

The "Repeat" position on the power switch enables the +/- 600 switch
on top of the radio for repeater use. For some neat IC-230 mods, see
my article in (ahem) the May 1977 issue of _73 Magazine_.

If there's nothing wrong with it, YES. I have the 2030 and it's a nice scanner. I use it in the house, it comes with an adapter for the wall. I got it for that price a year and a half ago because they only had 1 and it was the demo in the case. It was never used either.

Bret,

I use my 202 everyday on packet. Get a KPC-3 tnc (their great!).
You'll need a serial cable for the computer to tnc and then a cable for
the radio to tnc. MFJ sells the right cable for the 202. it's about $15.
The kpc-3 comes
with the cables to wire one up but you'll need a cap and a resistor as
well. Use the Icom 1AT diagram in the KPC-3 manual to make the radio
cable. No radio mods are required. I bought the radio cable first
because I had never wired anything up before but I did make the cable
about a week later and it wasn't hard at all. Worked like a charm!

Greetings.

Several years ago, I had fun building and using a base-loaded ground plane. This was for 10m, and the total height was about 4 ft. I used it inside my br in an apt. building. While a similar antenna for lower bands might be a bit taller, you should still be able to fit it indoors. Basics of calculating the inductance value of the loading coil, and the required dimensions, are in the ARRL Antenna Book. Of course with any indoor antenna, watch out for rf (In that apt. building, I had to disconnect power from the computerized alarm system the owner had installed, or I'd set it off!).

Hi Mark.

It's been a while since I travelled the area you mentioned, so I can't
offer a direct recommendation. What I usually do before a trip it to
get out the repeater directory and a map, and mark all repeater loc's
along/near my route. I know some of the locations listed in the directory
are not always easy to find on a map, but maybe you can get help along
those lines by posting to one of the other groups (since it wouldn't really
be an equipment question).

I was just looking at the FT-736R in the Yaesu catalog, and would like to hear any comments, pro or con, from anyone who has used this rig.

The idea of having all modes for 2m, 220, 70cm and 23cm available in one box is quite appealing, and cuts down on the total number of rigs needed in the shack.

Thanks in advance for any feedback.

> I was just looking at the FT-736R in the Yaesu catalog, and would like to
> hear any comments, pro or con, from anyone who has used this rig.

Jim -

Two friends have FT-736's, and I've had the opportunity to use them on FM and SSB. Dynamite rig, no doubt. Extremely flexible and sounds great.

Downsides: Expensive, as you've no doubt discovered. Complex to use, with control sequences that require some study of the manual. Buffaloed by the controls, one of my friends hasn't even used his on SSB yet.

Big Downside: For all that money and operational complexity, you get very little output power - 25W in 2m, 220, and 440, and 10W in the other bands. To bring a 736 up to "modern" power standards, you'll have to add amplifiers, and in the end you'll have about half as much again invested in amps as you do in the rig.

The power issue has been the one thing that's stood in the way of buying one for myself. Street price in the $1600-1800 range is a hefty chunk for what is almost a QRP rig! By the time you add the other modules and then amplifiers for everything, you've got $3500 tied-up in the thing! Ouch!

BEWARE OF REPEATER JAMMER SEEKING INFO ON "FINGERPRINTING"

There's recently been a thread on rec.radio.amateur.equipment from
someone claiming to be a new ham who has been mistaken for a jammer.
This person reports to have been confused for the jammer by virtue of
having bought a "Fingerprinted" radio off the jammer.

At different times in posts and private emails this person claimed:
To be using a girlfriends email account maryjohn@pipeline.com, but claimed
not to be "Mary Johnson" whose account this appears to be.
To be Mary Johnson.
To be KB2UXI - which doesn't fit!
To be a 15 year old male.
To be a married female.
To be a male named Larry Markson.
To have no technical knowledge - desperate for help.
To have some technical knowledge and has displayed same in some emails.

I have no earthly idea if this person is legit or not. But considering the
inconsistencies, caution does seem reasonable.

Chris, N7RME

Designed by hams for hams? I know that this is their marketing slogan, but I kind of agree with the above post. I think a real ham would have designed the rig to transmit on the entire two meter band.

Just another leading edge product from Radio Shark!

When I bought my 2M rig a few years ago, I did a little shopping for just such a mount. At the time, Larson sold a really nice mount that had fairly high-current power connections and a coaxial antenna connector all built into each half of the mount. They sell the whole thing as a package, and they also sell each half separately. I have no experience with these, as the $50+ price tag was a bit high for me at the time. However, it looked like a pretty good piece of work. Check with your local Larson reseller. Most places don't stock them, but they are (or were a few years ago) in the Larson catalog.

I ended up taking a cheap CB "slip mount" and using it to mount my rig. I then put a 4 conductor Jones plug on the power cable with 2 contacts for each lead to give adequate current capacity. This gives a nice quick connect/disconnect with low force. I put a 90-degree connector on the rig's antenna connector.

This points the cable in a more favorable direction for my application and also prevents wear and tear on the rig's connector. When I wear it out, I replace it. You could try a BNC type adapter, but I've found that BNC's usually don't hold up very well to frequent connect/disconnect cycles. They wear out quickly under these conditions.

Oscar,

I bought the sister rig the Paragon II about four months ago. In discussions with the Ten Tec rep, he advised me not to go with the Omni-VI unless I was a serious contester. I have talked to Omni-VI owners that love the rig. I love the Paragon II. Nothing but good reports.

My only complaint: the linear relay has to be activated/deactivated by opening up the cabinet and moving a jumper. Easy enough just to leave it on all the time, but that screws up the QSK keying.

Receiver is top notch and very quiet, even with my vertical.

Regards,

Duffy - WB8NUT

6296. Radio Shack Mobile DSP Info???

Radio Shack has a sale going on for their $79.95 "Mobile DSP" unit.
Now buyable at $49.95

Anyone had any experience with one of these3?

I'm thinking of using it with my Atlas 180 in the car (ssb only).

Thanks.

I am very close to deciding to spend the bucks on a Ten-Tec Omni VI and would very much like to hear of opinions and impressions of this radio both pro and con from anyone. Also if there are options to this radio that are a must, what are they? i.e. filters from Ten-Tec or after market such as fox tango if they make them for the VI. Would I possibly do better to go to something like the FT-1000D or KW 950-SDX or other? It's a big buck decision that I can afford to make only once. I'm really interested in a top notch receiver for both weak signal contacts as well as contests when the stations are packed like sardines. Any and all comments are most welcome.

Source record: 215243

I wonder how much different Kenwood's TS-850S (or SAT) and TS-950SD
are? Because I have been hunting for used equipment and found out
that 850 sells for about $1350 and 950 sells for about $2000 !
How come 950 is this inexpensive compared to price of the new,
which is $3899! So, I wonder why TS-950s are selling this cheap
as used..? Does 850 even beat 950 on some specifications?
Oh btw, how many models is there of TS-950.. I've been offered
used TS-950SD for $2075, but as I browse catalogs I see ads for
TS-950SDX. What's the difference between SD and SDX models?
Help me with this problem please.. I still don't know if this
TS-950SD is worth spending extra money compared to TS-850S.
Thanks in advance for all helpful repliers!

>
>
>Dislikes:
>
>1) This thing gets hammered by intermod from the massive array of paging
> transmitters, land-mobile, TV, and radio transmitters just five miles
> away.

I have always wondered why some people have a variety of experiences of intermod (ranging from little to full scale intermod). Jerry here lives 5 miles away from a radio site, while I live 100 yards away from a radio site (for Los County). I've visited the site (inside) and found that they serve LAPD, LA Sherrif, Forrestry Service, and a bunch of other services I don't know. The repeaters are for 42 Mhz , 155 Mhz, 484 Mhz, microwave stuff, 800mhz, pagers... (get the picture?)

I don't have any intermod problems with my 530 as long as I stay within the amateur band. But in some portions of the (470 Mhz) band I do get an occasional peep of intermod but never has it been a major problem (on my 530).

Now if I can't say the same with my RS PRO-37, with the 37 anything in the 440 spectrum is unuseable and I have to hook the scanner to an antenna tuned for 2m/70cm and the intermod on 440 is now barely tolerable now. But that is another story...

Assuming Jerry's and my radio are constructed equally why does he seem to have more problems with intermod than I do? I would think that my location would give me more problems than Jerry given my proximity to the radio site.

>2) Durability, lack thereof.
>3) Poor audio quality. What else can you expect from such a tiny speaker? My
> Motorola HT's have better audio than some mobile rigs I've used.
>4) The battery attachment mechanism seems weak.

Jerry, your point is well taken. The only radios that address these problems are commercial radios... Manly mans radios! As soon as Motorola (or any other commercial manufactorer) makes a dual band commercial radio (with PL and digital PL encode/decode, and field programmable, with 20 memories for each band) I will be the first in line to buy one. Just your basic dream radio.

>John KO4MY, "jmp@ipctech.com"

I fully agree with John's comments above on the size/features of the Yaesu FT-890 HF rig. It is a small rig but not totally ideal for mobile use since it is now a bit bigger than other rigs on the market. I also found the display a bit difficult to read in the mobile/sunny environment. Otherwise, it is a bulletproof rig(had mine for 4 years now with zero problems) and I enjoy using it on DXpeditions since it is "all inclusive" with cw keyer and antenna tuner built in.
For really mobile/portable use, I'm very pleased with my Alinco DX-70 HF rig. It is similar to the TS-50 with 6 meters and a detachable front panel included. It would be ideal for the "mustang" type installations and I drag it and a switching power supply with me when I travel.

Price of the FT-890 (AES closeout with ATU) is about 1250 and price of the Alinco is about 1175 US dollars.

>
>steve sheppard

Hi Steve, You might want to try a roadside truckstop
that has a CB-shop. They sell all kinds of quick
disconnect mounts for CB radio's, scanner, and other
mobile/portable equipment. I would suggest NOT using
any kind of quick disconnect antenna connection, as
these inevitably fail and damage to the rig could
occcur. However, "male" and "female" slide/lockable
mounting brackets are vy common. Mounting it to your
2400 would likely require using a combination of the
standard Yaesu bracket and the male or female quick
disconnect bracket. Typically, power (13.8vdc) and
speaker (external speaker) are quick disconnected with
these mounts.73 good luck bv2/n0iat Joe in Taiwan

>51R front-end is more sensitive. Has anyone one else
>encountered a similar problem and what was the resolution?

It's probably not more sensitive, but it's certainly less selective.
Use of a bandpass filter on outside antennas, such as the one sold
by Tucker, is highly recomended to cure these types of problems. Too
bad Yaesu didn't make the front end narrow to begin with, like the old
IC2AT had, but alas, scanneritis has struck the amateur HT market.

If only one signal is plaguing you, however, you may be able to insert
a trap in the line to notch it out and still retain the wideband scanning
feature. Tee a shorted halfwave of coax into the line (the halfwave at
the offending frequency of course), and that should solve the problem.

Gary

>
I've had my FT-530 quite a while now (at least 6-8 months, but it seems longer)
and am very pleased with it.
Direct random access of any memory is available from the keypad (if I get what
you're looking for) a) get into the correct band. b) press mr button. c) press
numbers for memory you want. d) maybe press mr again. If I had the radio here,
I could verify this, but I know it's pretty simple, as I do it all the time
while driving....

One accessory I'd not do without is the earphone with microphone so you can do
hands free VOX. It's really nice when driving, etc, (but you have to get used to
not talking back to people in other cars unless you want some really interesting
responses from your radio contacts...). Also works pretty well for just listening,
and if you've got vox turned off, you can use the boom mic normally by pressing the
xmit button. Besides, it's legal to drive with here in CA, as it only covers one
ear!.

I'm in San Jose, CA area, and haven't had many problems with intermod, only
occasionally in really tough locations (that other radios also have problems with)
or when running on a gain antenna at my home. Overall, very little to complain about.

Transmit performance is pretty good for a HT, and you can plug the unit into 12V in
your car (or with a battery pack) to increase both transmit power and time between
battery charges. (optional dc power cord for the car ciggy lighter socket has a
filter in it).

Yep, it does out of band receive as well, and I normally use the UHF side as a scanner
to keep track of the locals while talking on 2 meters, and the two meter side to
keep track of the CHP mobile extenders when working 440. Also kinda fun at the old

airport while waiting for connections (like last sunday in dallas/fort worth...)

The belt clip is pretty agressive, and takes a bit to get used to when removing the unit from your belt, but it sure isn't going to jump off if you need to take a hike or quick jog.

Now if I could only get my wife interested, so we could get rid of her cellular... I know I could buy a new radio each year and have change left over, compared to her cell phone bill, and she doesn't talk on the cellular all that much.

good luck in your search
-Rick

6313. SGC-2000 HF Rig. Anybody got one? Comments?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-14 00:00:00 UTC
From: geoffs@onr.com
Message-ID: <3u4of8$hjf@Sierra.onr.com>
Source record: 215256

The Bug has bitten to buy a new HF rig. I've thought about the HF rig that SGC puts out, it's called the SGC 2000. I've got the operators manual for it and it looks well thought out and *extremely* rugged.

It's obviously an adaptation of a marine radio since it has no tuning knob and really looks like it's optimized for channelized operation. It is type-approved for ham use and relatively cheap ($1400 from some places) compared to the riceboxes. It's easy to remote the head and the box itself doesn't look like it would come internally unglued rattling around in a hot trunk like some of the flimsy junk that comes from Japan.

OK. So, who's got one? I'd like to find out if the thing's any good (electrically) before I spend a lot of money on something like that which may be only so-so as far as ham use is concerned. I was extremely impressed with the construction and burn-in each radio receives prior to shipping and the transmitter looks tougher than anything else out there. WHat's the RX like? Is the synthesizer quiet? How's the dynamic range?

Please e-mail responses to geoffs@onr.com . Thanks in advance!

6318. Needed Estimates of Equipment Lost in Fire

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-14 00:00:00 UTC
From: bsg@jax.jaxnet.com
Message-ID: <3u4u9t$qf8@jaxnet.jaxnet.com>
Source record: 215261

My father recently lost the following equipment in a fire.

32S3 Collins Transmitter
75S3A Collins Receiver
Power Supply for the above
KWM2A Collins Transceiver
Heathkit SB220 Linear Amplifier
Drake 2B and with 2BQ
HQ140X Shortwave Receiver

Does anyone know the value of these items today, or what it would cost
to replace them? Is anyone trying to sell these items currently?

Any help would be greatly appreciated. My E-Mail address is bsg@jax.jaxnet.com

6319. Re: Yaesu ft530 opinions?

Hi Mike: Best dual band ht on the market right now with no intermod is FT-51R and also FT-530 got two different intermod, depend where you are if you need more info. call Yaesu technical support at 310-404-2700.

6320. ICOM IC-2340H Crossband Repeat

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-14 00:00:00 UTC
From: "Michael J. Freeman" <afn10044@freenet.ufl.edu>
Message-ID: <Pine.A32.3.91.950714000848.67433A-100000@freenet2.freenet.ufl.edu>
Source record: 215263

Does anyone know how to get ICOM's IC-2340H dual-band mobile to perform crossband repeat? I've already looked in the standard locations like oak.oakland.edu without any success.

Any information on invoking this mode of operation would be appreciated.

VINTAGE EQIUPMENT FOR SALE

1)Vintage Viking Challenger Cw transmitter modified for AM also. Included is VFO and a few crystals.

2) Lafayette HA800b receiver

3) Heathkit SWR/Power meter.

It has not been years since the equipment has been fired up. There should be essentially nothing wrong with any of the above equipment.

Equipment gos to the highest bidder.

Please E mail me back with questions or a quote if your interested.

Thanks

Carl Scarpa

This message describes the rec.radio.amateur.*, rec.radio.cb,
rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet
mailing list counterparts and complements. It is intended to serve as a
guide for the new reader on what to find where. Questions and comments may
be directed to the author, Jay Maynard, K5ZC, by Internet electronic mail at
jmaynard@admin5.hsc.uth.tmc.edu. This message was last changed on 31 October
1994 to add the discussion of non-Usenet mailing lists and streamline most
of the history discussion, and to change the moderator information for
rec.radio.info.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list
for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions
were held on the mailing list, and sent to the mailboxes of those who had
signed up for it. When the Usenet software was created, and net news as we
now know it was developed, a newsgroup was created for hams: net.ham-radio.
The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became
progressively higher. First one by one, and then as part of two
reorganizations, what was once one group became many. In the process,
developments elsewhere on the net were reflected in the groups as they were
created, most notably the change to place all of the ham radio groups in one
hierarchy.

The collection of newsgroups continues to grow as more people join the net,
and as more topics of discussion gain volume, I expect to see more groups be
created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the
notable exception being rec.radio.swap. There are also a few mailing lists
that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them,
and not to the groups that aren't. The whole idea of having different
```

newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups rec.radio.amateur.antenna, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

All of the following mailing lists are sponsored to the Boston Amateur Radio Club, as well as some others of local interest. Thanks to N1IST for the information.

qrp-l: This is the qrp mailing list, previously maintained by Bruce Walker at Think.com. It is for discussions about the design, construction, and use of qrp (low power) radios and related equipment.
arrl-ve-list: This is a one-way list, run by Bart Jahnke of the ARRL VEC, for announcements to VEs and VE teams.
w1aw-list: ARRL bulletins, news, and information
newsline-list: Redistribution of Amateur Radio Newsline
letter-list: Redistribution of the ARRL Letter
fox-list: Fox hunting and Radio Direction Finding
fieldorg-l: ARRL field organization discussions
ham-tech: Technical discussions and questions about Amateur Radio
arrl-exam-list: amateur radio license examinations scheduled in the US and in some foreign areas.

To sign up or inquire about these lists, send mail to listserv@netcom.com with the following in the body (subject is ignored) of the message.
<listname> is the name of the list to subscribe to.
To subscribe: subscribe <listname>
To unsubscribe: unsubscribe <listname>
For more information: help
To post (to the two-way lists), send your message to <listname>@netcom.com

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while

still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

6325. QRP ---> MFJ 9020

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-15 00:00:00 UTC
From: beretta1@ix.netcom.com
Message-ID: <3u8dbp$jdo@ixnews4.ix.netcom.com>
Source record: 215267

I haven't seen much on QRP equipment so I will add my comments on the MFJ CW rigs. I bought a 20m (9020) and put it on the air for Field Day. It has great selectivity with add-on audio filter and had a solid 3 watts output making contacts with almost every cq I answered. Calling CQ wasn't very effective but that is true with 100 watts on FD too! Any comments?

6326. Has this happened to you?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-15 00:00:00 UTC
From: tegennett@hfs.purdue.edu
Message-ID: <NEWTNews.29106.805824052.Postmaster@hfs105>
Source record: 215268

Something unusual happened last night to my Kenwood 732 dual band mobile. Several minutes after having turned it on, I noticed the display was doing the following:

It would appear normal, then the S-meters on both bands would alternately cycle from zero to full scale. While this was happening, then two green LED's by the volume/squelch knobs would flash in unison.

The display would then go blank, and the word "hello" would appear on each band's display, nothing else.

The first phenomena would repeat (cycling S meters) and the display would go blank again. Then the word "enjoy" would appear on the 2 meter portion of the display and the word "hobby" would appear in the 70 cm portion of the display.

The display would return to normal for several seconds and then whole cycle would repeat. The transmit and receive functions were not affected by this unusual operation of the display and the normal functioning of the display could be temporarily restored by operating any of the radio's controls. Once operating was over, the cycle would start in again.

For what it is worth, when I had turned the radio on before noticing this, I had turned it on while holding down the call channel button (don't ask why). Repeating this procedure did not restore the radio to normal functioning. I could not find any key combination to restore normal functioning. I finaly had to reset the micro processor which restored normal functioning but then had to spend the better part of an hour reprogramming the radio.

Has this happened to anyone else? And in case it happens to me again, is there a keyboard sequence that can reverse the change?

It was very hot here yesterday, but I don't think I imagined this.

>Thanks!

What they are probably trying to tell you, but it didn't
translate very well, is that the AA case does not contain a
circuit breaker like the ready-made NiCd packs do. If the case
were loaded with NiCds and an external short occurred, the much
higher short circuit current from the NiCds could be dangerous.
I'm curious why the radio attempts to charge this pack. That
could be a problem if you used alkalines as recommended. If you
have NiCds in it, then charging would be no problem, but short
circuits could.

I bought my TS-830S in 1981(brand new), and have not had even 1 problem with it. It has brought me from novice to extra without as much as a wimper. It even has the original finals in it. I installed both 500 cps filters in it when new since I do a lot of cw with it.

I also have a TS-440, with all of the filters (cw, ssb, am) and the FM unit, but I still love using my TS-830S. How about the rest of you 830 users out there ??

From: hillgen@er7.rutgers.edu
Message-ID: <3u8sme$18g@er7.rutgers.edu>
Source record: 215273

Hello all. I have a few Motorola Maxar 80's that I was given by a friend who seems to know nothing about them. One is crystaled for 144.990 and will transmit fine, but does not receive. I have checked to make sure that the problem is not just ablown speaker. I suspect that this radio was modified for packet use. If so, I suspect that the receive audio is routed through the multi conductor plug on the back of the radio...correct? Which pins could it be? Also, the second radio has crystals that read 19244.86 and 54167.91 What does this mean and where will the radio transmit and receive? Thanks to anyone who can help!
Jay

From: kajami@tarzan.math.jyu.fi
Message-ID: <3u7hf4$3ie@mordred.cc.jyu.fi>
Source record: 215276

Ok... I made some phonecalls about these two transceivers..
I asked what's the difference between TS-950 SD and SDX models?
But the guy at the other end couldn't tell.. I Couldn't get
through on Kenwood's tech support either, time I had to stay
on hold started to feel bit too long.. So can anyone tell me
what is the difference between SD and SDX please? Only thing
I found out was that due to user complaints the SD model was
upgraded with some new features and that upgraded version
became SDX. What are these upgrades? Someone please help
me with this. Thanks in advance! Email reply preferred.

I think the warning pretains to the NiCads that don't have, or have
inadequate insulation around the body. I use NiCad AA cells in
mine, and have never had any problems.

Ok lets try this again! I messed up my response to you Dan (I guess). And some other person sent me your answer also; so thats two of us who did not get through to you!

The power switch will put you into 600 khz split mode and the switch on top will control either a plus or a minus 600.

Andy N2GSA

Now lets see if I can post this. Gee I used to know how to work my newsreader.....?!

>the shack.

These are lovely rigs, I have one setting next to me at the moment.
They only have one drawback. There is only one receive and one
transmit channel active at a time. You can receive on any *one*
of the bands, and transmit on any one of the bands at the same time,
but you can't dual receive. That's not important for satellite use,
where these radios really shine, but it can be a pain if you use
one for general purposes and want to be able to monitor more than
one band at once. Otherwise, the features and performance are
lightyears ahead of the Kenwood 790A, and the cost is a lot less
than the Icom 970. The newer Icom 820H has some peculiarities that
hamper its use with satellites, so it looks like the old workhorse
736R is still the cost/performance champ for now. IMHO, the ultimate
setup is still the Icom separates, IE the IC-x75 series, but the
FT-736R will serve you well.

I have a mint condition ICOM 2GAT Handheld radio for sale.
Its features are:
Lit LCD Display, Numeric Keypad.

etc. On low power it puts out 1 watt, but on high
power it puts out SEVEN (Yes, seven) Watts! It comes with all
original packaging and manuals intact, a rubber shock resistant
case, and an ICOM hand held mini-microphone with cord and tx light.
The radio is 2 years old and in fine condition. Radio plus
accessories will cost you $257 shipped via UPS INSURED!!!

Call or email if you have questions:
(401)-789-5938
swamik@ele.uri.edu

Jani:

Although I'm not familiar with the 950SD from a technical perspective, I do know that it wasn't a big seller; when the 850 went on the market, sales of the 950 stalled. The 950 was quickly succeeded by an excellent radio, the 950SDX. For the $1350, I'd recommend the 850S-AT over a $2000 950SDX. I've had one for 3 1/2 years and have enjoyed it very much. It's got excellent receiver performance, good built-in filtering, and a good transmitter. Jani, Good luck with your purchase.

6342. HTX-202 questions

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-15 00:00:00 UTC
From: bobsmith@cbnewsk.cb.att.com
Message-ID: <DBrt9L.JJ5@nntpa.cb.att.com>
Source record: 215284

How hot is the Radio Shack HTX-202 supposed to get if running from the cigarette lighter at full power? I can't even hold the HT after about 10 minutes of transmitting. Is this normal? Do other brands of HTs do the same thing?

The HT now has a beep after transmitting for a while. The two HTX-202s I had before did not do this and the beep is annoying. The beep occurs after releasing the PTT. Anyone know why this happens? The settings are the same as my other units (which failed transmitting and were replaced by RS).

Thanks,

Bob Smith

>Radio Shack has a sale going on for their $79.95 "Mobile DSP" unit.
>Now buyable at $49.95
>
>Anyone had any experience with one of these3?

I liked mine so much I bought a spare at the sale price.
Some people have criticized the RS unit because it does not have
an active noise reduction circuit. They should realize its also
one-fourth the price of a decent unit with actual noise reduction
circuitry. What the RS does very well is remove carriers, and
provide exceptional CW filters. I used mine in last years Sweepstakes
and 160 M contests and was not bothered by high powered stations less
than 500 hz away.
At 50.00 it's a steal.
Regards, John

I own one, I think its worth $49 bucks. It helps some on SSB.
You know you cant do a whole lot on SSB filtering without hurting quality
of the SSB. On CW it is better than several audio filters ive owned.
It also will totally remove a carrier on 40 meters on SSB.
Again it is well worth $49 bucks to me!

Bob,
The HT should get hot after 10 mins. of transmiting I think. I just
bought the dc adapter myself and it puts out 6 watts on high power
according to the docs. It may be putting out more, I have to check with
the power meter.
As for the beeps,I'm not sure what's up there unless it's the courtesy
beeps your refering to. Maybe you should take it in to be looked at. You
DID get the service contract didn't you?!

Mike Musick/N0QBF (mmusick@talx.com) wrote:
[snip]
: Big Downside: For all that money and operational complexity, you get very
: little output power - 25W in 2m, 220, and 440, and 10W in the other bands.
: To bring a 736 up to "modern" power standards, you'll have to add
: amplifiers, and in the end you'll have about half as much again invested
: in amps as you do in the rig.

: The power issue has been the one thing that's stood in the way of buying
: one for myself. Street price in the $1600-1800 range is a hefty chunk for
: what is almost a QRP rig! By the time you add the other modules and then
: amplifiers for everything, you've got $3500 tied-up in the thing! Ouch!

Your point is well taken. However, to get a rig with decent output power
on VHF or UHF, you're almost looking at $2,000 for a mono- or dual-band
rig, with no expandability to other bands. I have been admiring the Icom
IC-275/IC-475 for some time, and that is the case there. Plus, Icom seems
to be discontinuing the 10m/6m model, the IC-575.

Another option I'm looking at is the Icom 706, yet to be released. This rig
affords 6m/2m all-mode operation; 100w on 6, but just 10w on 2.

Based on your otherwise high recommendation of the FT-736R, I might be
willing to spend the bucks, then add amps later. My wife will probably get
her Tech license by summer's end, and we can both enjoy the rig.

Thanks for taking the time to add your valuable insight!

Thanks for your comments, Gary. Yes, as I replied to the other fellow who commented, I have been admiring the Icom IC-x75 line for some time, but that doesn't address 220 or 1.2G. The 220 band is quite popular here for repeaters, primarily due to overcrowding on all other VHF/UHF bands. In fact, our club operates a 220 repeater. Apparently Icom has discontinued the IC-575. With all that's happening on 6m this summer, I'd sure like to have one. Maybe Icom should have stuck to its monoband concept and made the 575 strictly 6m. Just about any HF rig has 10m, and FM/repeater use on 10m is virtually non-existent, which is surprising in the LA area.

I'll see where this thread leads, but I'm pretty much convinced about the Yaesu rig.

The LogiKey is a commercial version of the CMOS Super Keyer which was
featured in the ARRL Handbook from about 90 to 94 (and perhaps still
is, my last copy was 94). It was originally marketed as a kit by
Idiom Press. I bought the kit, it works fine, I'm totally delighted
with it. The kit is reasonably priced compared to the made-up
version, but you do need good soldering skills - some of those tracks
are very small.

Some time ago I used some Katsumi and other Japanese brands, but they
didn't offer anything like the flexibility of the one you have used.

Keyers are a very personal thing. You might like timing logic of one
but the memory functions of another. That's probably why the Super
Keyer designers put so many emulation options into their software.
I'd be cautious about buying a keyer that did not let me adjust some
of those parameters.

I have seen this happen with mine, and what I have heard is that there
are diodes that overhead if you try and run off the cigarette lighter
AND leave the battery pack in. Apparently you can cook the diodes
doing this, so I don't leave the battery pack on while using the lighter
and I don't have the heating problem anymore.

Plus the battery was just being drained anyway (would have been nice
if it had been charging).

I have also heard that transmitting on full power from 13.8V into the
rubber duck is a bad idea with the HT202, so I also avoid this (I
measured the SWR once and it wasn't impressive).

What does it take to be able to use 2 UHF walkie talkies over a distance of about 6 to 6 3/4 miles? I'm going to Ocean city in about a month and my friend rented a place with out a phone. What a moron. Anyway we need to communicate. Any suggestions?

Corben.

You can still order crystals through Radio Shack. I just ordered some
for $4.95 each. The arrived in just a few days.

>
>I would like to improve my receive. I have 300 feet of coaxial cable
>between my beam and my radio. If I use a receive RX amplifier as close
>to the radio, I think it will not do a lot.

Correct. The loss of the cable will have already set a minimum NF
higher than the preamp is capable of supplying, so the preamp does
no good. It will depress the 3rd order intercept to the receiving
system while not improving NF, the worst of both worlds.

>I think it should be better having this amplifier as close as possible to
>the antenna. There is only one problem. When I'd make a home made RX
>amplifier it will not resist the TX power and blow immediately, so
>I need one that reroutes the line over the amplifier so I can't blow it.

Correct again. Putting the preamp at the antenna will be most effective.
You now need TR switching at the antenna to prevent preamp burnout.
There are several ways to do this. One good way is to run two coaxes
from the shack, one transmit and one receive (containing preamp), and
use a coax relay at the antenna to transfer from one to the other.
Since the preamp has set the system NF, you can use higher loss coax
on the receive line now, so the cost doesn't get out of hand. Naturally,
you need a way to control the relay. One good way is to phantom power
up the coaxes. The preamp can be powered by phantoming on the receive
coax, and the TR relay can be switched by phantoming on the transmit
coax. Now all you need down in the shack is a way to switch power from
one coax to another when you want to TR. This should be done by a
sequencer so that the relay is switched before PTT is active.

Another method, used in commercial preamps, is to use a pair of
relays to bypass the preamp during transmit that are switched by
an RF sensing circuit in the preamp. This can work for low transmit
powers, but if you're running 100 watts or more it won't work so
well. The preamp still sees a spike of transmit power before the
relays can switch, and that'll blow the preamp. Most commercial
preamps have provision for DC switching the relays as an alterative,
and you can do that with a sequencer like in the previous case, but
since there's only one coax now you'll have to run separate DC wiring
to the preamp to do it.

There are still problems with this latter approach. Many preamps
will be unstable if their output is not properly terminated, so
during transmit the preamp may oscillate and perhaps damage itself.
Also, the isolation provided by the relay pair may be insufficient
at high power and may still blow the preamp. An alternative is to

use *two* pairs of relays arranged so that the preamp input and
output are switched to 50 ohm terminators during transmit. This
is nearly foolproof, but now the cost of high quality coax relays
is getting out of hand. Its probably going to be lots cheaper
just to run a separate receive coax as explained above.

>Does such amplifiers exist?? Commercial ones???

Yes, several. SSB Electronics, Landwehr, Toyko Hi-Power, and Advanced
Receiver Research all market suitable switched preamps. Or you can
buy a raw preamp from ARR (or build your own) and wire up your own
relay switching. Transco relays are good, and are available surplus
from outfits like The RF Connection. Most run on 28 VDC, however,
so you may have to build a relay power supply too (or change the
coil to a 12 VDC one).

well, the obvious answer is a well located repeater. i had the same problem but was able to communicate a good 20 miles by using a good repeater. another option is to get yourself a well situated antenna, a 3 element beam perhaps mounted on the roof pointed at your house (if you're only going to talk to one other person, no sense putting a roter up there). there's also the option of an amplifier.

>After all, the waveguide is just a very short piece of transmission
>line, isn't it?

If you matched the waveguide to the wave floating inside the shield enclosure with an efficient network exciting the TE 1,1 mode, and loaded the waveguide output with its characteristic impedance, then you'd only be left with the attenuation of the waveguide. However, the only way I can think to match the hole to the 30 meter waves is with conical horns, 15 meters at the mouth and tapering to 1/16 inch at the apex. If the shield box were only say 6x9x4 inches, it might be hard to fit the horn inside. :-)

If you tried to excite the TEM mode, you'd need a probe 7.5 meters long fitted transversely inside the waveguide 3.75 meters from one end, and that won't fit either because the waveguide is both narrower and shorter than that.

Perhaps you could come up with a lumped element equivalent of one of those approaches, but I don't see how you could and still acheive any reasonable efficiency. An electrical quarterwave probe physically only 1/32 inch long would have horrible efficiency, and you would be back in the same boat. The shunt impedance of the waveguide at 30 meters would be very very low, with a current density some 9 million times the free space value. I don't see how you could build an efficient network with that sort of circulating current. I^2*R losses in the network would be overwhelming.

Of course you could just stick a wire *through* the hole, but that would be cheating. :-)

I don't have a schematic of that unit, but Icom generally includes
a reverse polarity protection diode in shunt across the input. That
may have bought it during the reverse voltage application before
the fuse blew. I'd be looking for a shunt diode very near the power
input.

If this is the European version of the IC2AT, then its a wonderful old
brick. It's very simple to operate and nearly indestructable. It also
doesn't suffer as badly from the howling intermod as more recent wide
band HTs.

6372. ICOM 737A CW/N problem! Also, IC736/738 ?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-16 00:00:00 UTC
From: wilder@clark.net
Message-ID: <3ubi2i$okg@clarknet.clark.net>
Source record: 215165

Next month, I will modify a 737A with a 250 Hz CW filter to fix a basic design problem with the CW-narrow (CW/N) and Pass Band Tuning (PBT) operation. Have you had the below problem with the 737A or the newer 736/738? If the 736/738 has a fix, I will purchase a 736/738 manual and UPGRADE my radio to the newer design instead of MODIFYING to my design. (UPGRADE beats MODIFY at resale time.) Here is the problem.

Before you push CW/N, one must first center the PBT know. If you don't , and the PBT is well off center, you hear nothing. ICOM-USA in WA said that this is normal. In normal operation, one would probably have the PBT off center, to narrow bandwidth, before finally activating the 250 Hz filter and adjusting the frequency of the radio to center the signal in the narrow bandwidth. Now, one needs THREE hands to operate the radio; hands on the CW/N, PBT, and main tuning.

An easy way to test your radio is to run the complementary problem. That is, tune in a carrier while in CW/N and play with the PBT know to see what happends. (I good signal generator is a local AM broadcast station -- known frequency and constant level.) Set the PBT to detent center. Set your dial to station frequency. Push CW/N and observe full carrier on S-meter. Rotate the PBT know to about 9 o'clock and the receiver goes Dead.

My MODIFICATION would use the voltage from the CW/N button to activate a switching circuit. When pressed, the PBT circuit would receive voltage from a constant source equal to the voltage at the center of the PBT potentiometer and, thus, the PBT knob would not be functional. Otherwise, the PBT knob would provide the PBT circuit its voltage.

I will modify the 737A well in advance of the contest season. I hope you have some comments for me. However, feel free to inquire about the results and circuit of the final modification.

73, Dick Wilder, K3DI in Maryland. Connected to DXcluster EVERY day.

Of course, an outside antenna is desired but not handy. My suggestion is
to wrap a couple turns of wire around your telephone and connect the wire
to the antenna terminal of the radio. We hope that sufficient radio
signals have entered the building via the telepone "transmission line"
from their exterior "antenna;" the telephone equipment. Ain't easy.

I've had my DSP-40 for a year now find that it works OK. It is not as good as the more expensive units (you get what you pay for), but it noticebly improves reception under certain condx. I primarily use it for HF (IC-735) and my various VHF/UHF multimode rigs. Where it really shines though is on CW and it does an excellent job in reducing interference and narrowing audio bandwith.

Audio output is only moderate. I haven't used it in the car yet. If I use headphones I prefer the rear speaker jack instead of the front one. The front jack doesn't put out enough audio.

Hope this helps.....RANDALL

Perry:
I have a Realistic PRO-12 4ch mobile scanner(probably an earlier version of yours), and I can still get crystals for mine from Radio Shack. It will probably cost you about $5.00 per crystal, and the store will have to order them, which takes about a week. By the way, my PRO-12 was manufactured in 1974, so yours might have been made a few years after that. To find out for sure, check for a sticker with a date code like this "5A4", etc. Since you know the scanner was made in the '70's, the "5" would mean May, and the "4" would be the year, in this case 1974. "5A6" would be May, 1976, 12A4 would december 1974 etc.

Hope this helps,

Lou, I have had an Yaesu FT-1000D and sold it and purchased as Omni - VI. Although the 1000 was a very good radio, it cost much too much to send it back to Wa from Ok for repair, $ 180 UPS air. The Omni is much lighter and you can exchange boards. I have been through the plant and met many of the people at Ten Tec. I feel they are very knowledgeable and give super support. I operate SSB, RTTY, pactor, amtor, clover, G-Tor and cw and find the radio works great. It only has 100 watts out, and need a fan for 100% duty cycle on RTTY. I have had it over a year and have no regrets. de Dick, N5XRD. hemngway@aardvark.ucs.uoknor.edu.

It is not an adaptation of a marine radio, it *is* a marine radio.
It is also type accepted for aviation use. What SGC did was to
leave the band limits out of the software and equip th unit with
LSB and AM in addition to USB (all marine traffic is USB).
Ham radios are not type accepted. It is up to the ham to make sure
that the radio is operating within tolerances.

SGC has just announced a new version with DSP and a *knob*.
It appears to be aimed strictly at the ham market since it
does not seem to have the marine alarm feature.

Hope this helps.

6384. NEED HELP FOR BLIND HAM

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-16 00:00:00 UTC
From: Bill.Hommel@f53.n121.z1.fidonet.org
Message-ID: <def_9507220018@woodybbs.com>
Source record: 215177

Greetings, All!

I have a question for anyone that has had experience with handi-hams or knows a visually impaired operator.

Our club has a new member. By "new," I mean NEW! SHE is a retired teacher who took the novice/tech class put on by our club (Yellow Thunder ARC), and passed the test(s) on the first try. She put more interest and enthusiasm into her goal than I've seen from people less than half her age (including yours truly!).

She is legally blind, and either reads large-type texts, or uses a magnifying reader device that looks like a crystal ball sawed in half.

She now is wants to spend some of her nest egg on an HF rig, and needs something that is equipped with a voice synthesizer for the freq. readout, etc.

I would appreciate hearing from anyone that has info or comments to pass along about a rig that might be a good candidate for her.

Thanks, and 73!

Bill KA9QFJ

From: bgn00@juts.ccc.amdahl.com
Message-ID: <3udqo5$lsg_001@spg.amdahl.com>
Source record: 215101

I have a problem with the Kenwood MC-45 Microphone. This Microphone is in need of a new MIC element. It was the Touch Tone Microphone sold in or about 1978. The problem is that Pacific Coast Parts, the Kenwood parts distributor, can not seem to Identify the correct microphone element. The reason for this is that Kenwood sells an MC-45 microphone now, but isn't even close to the older model with the same model number.

What I am looking for is anyone with the original owners sheet on the MC-45 touch tone mic sold in the late 70's. I am hoping to find the Kenwood part number for the element.

Thanks for reading,
Bill "K8WN"

>
>Thanks in advance for any feedback.
>
>Jim
>

Hi Jim,

I recently purchased the 736R and I really like it. Its good some cool
features for sat work (which is the main reason I purchased it). I do
have a couple of complaints:

1. The built is speaker sucks. You can buy an external
Yaesu one for about ~$120 mailorder.

2. The radio does *not* come with CTCSS support. That is
an optional module which will cost you an extra $60
mailorder.

3. It can only RX on the amateur bands. No aircraft or
weather sats. There are mods to open it up a little,
but not enough, in my opinion.

Overall, I'm very happy with the radio.

Thanks,
Kory

These go for around US$300 - US$350 depending on condition. For one that hasn't been used in that long, the condition of the electrolytic capacitors in the power supply is an issue. They dry out and otherwise go bad. Your best bet is to power the rig through a variac, and bring the power up slowly to let the caps re-form. Check the voltage and ripple on the high voltage very carefully, taking all due precautions for working with high voltages (I guess you already know that these rigs have vacuum tube drivers and finals). The -101E is a pretty nice, although basic, rig. Best of luck.

: band's display, nothing else.

.....

: The first phenomena would repeat (cycling S meters) and the display would go
: blank again. Then the word "enjoy" would appear on the 2 meter portion of the
: display and the word "hobby" would appear in the 70 cm portion of the display.

.....

: It was very hot here yesterday, but I don't think I imagined this.

Well, it seems is if we may have a case of programmer humor here. From my
perspective as someone who has put out turnkey product software/firmware,
this kind of thing does not help the consumer image of the manufacturer.
I'm certainly not going to try to reproduce this on MY 732A...I don't have
the time to set it up again. In any case, if there was that much memory
left unused when they wrote the firmware, why didn't they add some more
features. ..... Yes! Yes! More! More!

My own opinions...certainly not my employer's...

This isn't like the IC2AT but like the IC2iA. This little radio is
great for sitting in my wife's purse, for the occasional use, but has
not built-in keypad (need to use the HM75/77). Not much power, and
accessories are hard to get your hands on.

:
: Police Radars are not infallible. Does anybody know of anybody
: that has beaten one in a court of law ?
:
: Some guy took his speeding ticket all the way to the Ga Court of
: Appeals, not sure how he made out though.

Oh sure. Look if you get a ticket based on a radar, you need to go
to the library and look at the ga code on use of radar by city and
county police and then by the state patrol.

here's the catch, city and counties are tightly regulated by the state
office of public safety; if they don't follow the rules in catching
you (anti speed trap law) or don't have
the calibration paperwork on their radars, you get off. a bunch of
people got off tickets in cobb county two years ago because a whole
fleet of radars were improperly calibrated for about three weeks.

finally, you should generally show up in court prepared to argue on
one of these bases that the speed measurement was improperly taken. many
times, the policeman doesn't show up-especially in atlanta/fulton-and
the state has no witness against you--case dismissed. if he does, you
may want to go ahead and pay your fine to the court recorder before
the judge ups the ante because he/she is not overly impressed with
your lame argument and abuse of his/her time.

state patrol is harder to beat--less state law between you and them.

>Hi everyone,
>I'm about to by my self a Kenwood 850s\at, could someone tell me the
>"pro's" and "con's" of that rig.

>73 de Jeff, soon to be licenced

Hi Jeff:
I treated myself to one of these. I like it, but there are a few
things you'll want to evaluate. We'll start with the things to watch
out for:

1) Slow serial data control. If you figure to use this rig under
computer control, you'll find that it takes a few seconds to transfer
the commands, and get the status back. For quantified data, and a
comparison against other rigs, I suggest you contact one of the
controlling software (often logging, too) companies.

2) No band data output. If you want automatic selection of antennae,
or something else band-specific to happen, the TS-850 doesn't offer
it. Some other rigs do. If you have a PC, you may be able to get
this feature via the PC.

3) If you look at the ads for the '850, look at the LCD. Notice the
"ghosting" - segments which are supposed to be "off", but are somewhat
visible? This is honesty in advertising - the rig's display really
_is_ like that. This may bother some.

4) The LCD is illuminated, trying to appear like a nice
vacuum-fluorescent display. Washes out (ie you can't read it!) in
bright sunlight, but quite nice indoors. Evaluate the impact of this
based on your intended usage. I've not been troubled by it, even when
operating on vacation. Most of my usage in indoors, from a
north-facing room, natural light from the side.

Now onto some of the plusses:

5) Super-heavy-duty output stage. I've run full-power teletype for
40 minutes at a stretch, no problems.

6) Quiet cooling. The fan uses a temperature sensor, and I've not
been aware of it being "on" even under extended TTY operation as
above.

7) Flexible interference fighting controls. I occasionally use the
notch filter, to take out a heterodyne that bug me. Note that this
notch doesn't auto-track the offending signal. The IF passband edge

tuning are two controls I use _all_ the time, in every mode. I tweak them depending upon specific conditions.

8) Nice AGC. When used standalone, the rig is smooth. When I've borrowed a friend's DSP add-on, the good AGC makes the DSP unit perform to its maximum (while we've seen that performance is not so great on older rigs with compromise AGC or pumping). Probably all modern rigs would give you this though.

Probably others can/will add their thoughts. A lot you can read in the ad copy. If you have a Web browser, do a search - you should come up with mods or reviews, or other comparisons.

Best of luck,
Gordon Pritchard VE7AGW
(gpritcha@vanieee.wimsey.bc.ca)

I see in the ad's for most "mid-priced" HF rigs that it says that they have AM & FM operating modes. Questions...
1. Does this mean that they work on the "repeater/no-code" frequencies(2m/144mhz/440mhz) ?
2. Will I then only have to buy one HT for the above mentioned freq.'s so I can talk to my wife at home(on the HF rig) while I use the HT(or vice versa) ?
3. If not that what does it mean ?

P.S. I am asking these questions because i am shopping for an HF rig.

I have a Bendix/King 5141 handheld radio. It's the standard public service type radio. I already know how to field program it for public service frequencies (yes, I am authorized to use them). I just recently got my ham license and would like to program it with some local ham repeaters. I know that it is possible to put ham freqs in it, but I don't know how. I do know that something has to be over-ridden to make it accept them. Does anybody know how? Any help would be appreciated. The local King dealer will program it for me, but they won't share the secret.

Thanks,

Sarah

6410. AM filters?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-17 00:00:00 UTC
From: turner@safety.ICS.UCI.EDU
Message-ID: <5020.805957545@safety.ics.uci.edu>
Source record: 215180

Anyone know much about AM filtering? I have gotten an IRCI AM crystal filter for my TS 940, it has a 6 kHz 6 db bandwidth. I wonder if this is a good filter for AM SWBC. I don't like "narrow" sounding AM very much, and prefer fidelity with hetrodynes, hi hi.

Anyone out there have a reasonable ear for these things? My Drake R-4C has an 8 kHz AM bandwidth, and that seems just fine to my ear. I can't even begin to listen to the AM signals using my SSB filters at 2.4 kHz (that is what the AM "narrow" is for the TS 940), seems all the brightness is gone, and I cannot make out the voices very well.

I suspect I will just stay with the cheapie ceramic AM filter that is in the 940, but just wanted to check with anyone in the know about this.

Clark
WA3JPG

P.S. If anyone is interested in the IRCI AM filter, let me know, I will probably sell it. It fits the 930, 940, 850, etc. I believe. I can check the IRCI catalog - it is for the 8.8 kHz IF.

6411. Need advice, TenTec Herc 444 amp

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-17 00:00:00 UTC
From: turner@safety.ICS.UCI.EDU
Message-ID: <5059.805957870@safety.ics.uci.edu>
Source record: 215181

Anyone out there have the old Ten Tec Hercules 444? I just got one to play with, I am considering keeping it, but am having some trouble getting it to relax, hi hi. It has so many protection circuits to save the finals, that it is very prone to shut down.

I wonder if anyone has worked inside one of these and how strong the transistors really are..... I notice that the amp shuts down way short of the maximum collector current, and I might want to reset the limits to allow me to reach maximum rated (in the Ten Tec manual). I would like to correspond with anyone who has tried this or has some ideas.

Thanks

Clark

Any kind of outside or window mount antenna will probably do. I cary a handy talkie with a mag mount and a 30" Dimond/Comet dual band antenna for the rental car and then put it on the heater/cooler or refridgerator in the room. Use of a handy talkie amplifier (RF comcepts type) and a mag mount antenna should do the trick. If one or both rooms face one another and have some elevation ... high rise hotel. You should be able to work with handies and rubber ducks.

: >
: >Suppose I put a matching network on one side of the hole to
: >tune out the mismatch. How does the equation account for this?
: >After all, the waveguide is just a very short piece of transmission
: >line, isn't it?

: If you matched the waveguide to the wave floating inside the shield
: enclosure with an efficient network exciting the TE 1,1 mode, and
: loaded the waveguide output with its characteristic impedance, then
: you'd only be left with the attenuation of the waveguide. However,
: the only way I can think to match the hole to the 30 meter waves is
: with conical horns, 15 meters at the mouth and tapering to 1/16 inch
: at the apex. If the shield box were only say 6x9x4 inches, it might
: be hard to fit the horn inside. :-)

How does aperture coupling of helical filters work? Don't those
shields with holes in them resemble short waveguides below cutoff?
For instance, I have a 6 meter helical filter with 0.6 dB of
insertion loss, even though the aperture is 2.1 inches across.
Come to think of it, I've seen HF coils doing a good job of coupling
to each other.

It might be useful to consider the possibility of cascaded waveguides.
When building a shielded enclosure, the box itself forms a waveguide.
In fact, when I sometimes design RF circuits such that the box waveguide
reduces interactions between the cover and inductors. Thus, the
circuit performs equally well (hopefully) whether the cover is on
or off. Obviously, holes in the cover aren't a big factor if the
cover isn't needed!

Finally, there is the situation where it really doesn't work, but
since its never been tested properly, nobody knows there is a
problem. Suppose your roof "leaked" but it never rained enough
to realize the problem?

Carl,

There are not any hard and fast rules as to the value of your gear or any
gear for that matter. It is worth what someone will pay you for it.
Vintage gear like yours is not worth very much so don't go to a lot of expense
such as shipping,repair etc.
I have a transmitter like yours that is in excellent condition and it is worth
maybe 50.00.
As to the receiver maybe 40.00 to 50.00, mainly due to the fact that it is not
a very common brand such as Hallicrafters,National or some of the other
popular brands that still have a parts pool available.
At any rate just because it is "old" or "antique" or "vintage" does not mean
that it is valuable in terms of dollars. Todays Hams don't want to use tube
equipment to any great extent, they want to get on the band without having to
tune up tubes like todays high performance solid state equipment allows.

>either. Just ask any tech who works for ICOM, Kenwood, Yeasu etc
>about all the modifications they have had to straighten out. And
>that is if the radio were not boogered up to unmodify.

I must point something out here. You, jkepler (sorry, I don't know your name or your call since you didn't put it anywhere in your message), seem to point out that performing "mods" on radios is something you should only do if you are able to repair it. I agree with this, in the case of true hardware mods, i.e. basically redesigning the radio. However, most mods are either software mods (press a couple buttons simultaneously), or REALLY simple published mods (like "clip the green wire"). I see no problem in this.

I do have another question, which I thought I'd ask now, while we're talking about modifications. Why does everybody make a big stink about the cellular phone portions of the band being blocked out on scanners and extended-receive UHF radios? Now I don't know the specifics of exactly WHAT is blocked out (is it just the cell-phone freqs or does it extend past that somewhat?) but if all you have to do is sit there and listen to other folks' phone conversations, well, you need to get out a little more. So I don't see the big deal. Or am I missing something (very possible)? Just wondering.

>Yes. The Bazooka antenna achieves increased bandwidth by
>providing a shunt reactance of opposite sign to that of the antenna
>off resonance.

IMHO that should be re-worded to say....A *REAL* Bazooka antenna......

The typical "Bazooka" made from 50 ohm line does not perform correctly. The bandwidth increase is from increased losses in the antenna and larger conductor diameter. To show how un-important the stub effect is you can cut the center conductor where it crosses the feedpoint and measure the BW. Every time I have done that the BW has remained the same or actually improved!!!

> snip>

>All things considered, the Bazooka is not a very efficent antenna
compared
>to the alternatives.

That's certainly a true statement! I use a bow tie dipole with two feet of spread on 80 meters. It covers the entire band with very low SWR. Chapter 18 of Walt Maxwell's book Reflections covers this antenna in great detail. He also states that the stub can NOT have any sigificant affect on bandwidth.

Date: 1995-07-18 00:00:00 UTC
From: jbhertzb@unix.amherst.edu
Message-ID: <3uh3d8$mgc@amhux3.amherst.edu>
Source record: 215060

Hi. I tried posting this question to this newsgroup a few days ago, but I'm not sure it ever appeared, so I'll ask it again: I'm looking for an inexpensive 2m HT, in the $250 and under range. I've heard that two companies make models in my price range: Radio Shack and Standard. I've looked at the Radio Shack model and don't like it; I know nothing about the Standard HT. If you have one, can you tell me about it? What is the model number? Does it have a key-pad and tone-squelch? How reliable and durable is it? How good is Standard's warranty?

Thanks much. Perhaps I'll meet you on the air sometime. 73!

> appreciated. 73's Mike KS4DA (Green COve SPrings, FL)

I've had one (a 751a) for the last five years and am quite happy with
it. It has a pretty fair receiver, the transmitter doesn't mind long
RTTY QSOs, and the controls are laid out logically. The display tends
to wash out in bright light (this is a problem if you're mobile) and
you certainly don't want to let the lithium battery that maintains the
band-edge info go flat(*), but these aren't major concerns. As for
the relay, it's almost silent - so is the fan on its low setting.

regards,
Ross ve6pdq

(*) there is an aftermarket replacement for the battery/memory card.
I've got a reference around somewhere if anyone's interested.

>versa) ?
>3. If not that what does it mean ?
>
>P.S. I am asking these questions because i am shopping for an HF rig.

Hi Buddy. Very few HF rigs will allow operation on the VHF and UHF bands (those allowed for operation by no-code hams). However, amateurs are allowed to operate AM mode on any of the high frequency (1.8 thru 30 Mhz) bands (except 30 meters 10.1 ~ 10.150 Mhz) and are also allowed to operate narrow-band FM mode on the 10 meter (28-29.7 Mhz) band. Though the mode of operation (FM) is the same as what you are familiar with in your VHF/UHF work, the OPERATING FREQUENCY is different. Your HT is likely designed for either 2 meters, 1.25 Meters, or 70 Cm operation (144 Mhz, 220 Mhz, or 440 Mhz respectively). You would not be able to communicate with a VHF or UHF radio using an HF transceiver.

Please note that a FEW models of HF rigs now come equipped with the 6 meter amateur band (50
Mhz) which a no-code ham is authorized to use, however, you would also have to be equipped with a 6-meter (50 Mhz) HT. This is not extremely likely, as only 1 or 2 companies are making these HT's, and they are very uncommon in the USA. Only one HF rig (TMK) has a provision for operation on the VHF and UHF bands. This is the Yaesu FT-0767GX. Otherwise, the HF rigs are designed for "high frequency" only.

That's different. In these cases we have resonant structures, and the coupling equation I stated doesn't apply the same way. Think of it like a low loss coax with a high VSWR. The matching may be bad, but the RF gets lots of chances to couple as it circulates. The coupling hole has much the same effect as a small value capacitor coupling the two circuits (the mechanism is different, but the effect is much the same). As long as circuit losses are low, most of the power will *eventually* couple from one to another.

Now a shielded box can be considered a resonant cavity, but to be effective, it has to be resonant at a frequency far from that of the energy it is trying to shield in order that the circulating currents passing the hole not be high and the energy not be given many chances to radiate out the hole. Just consider your coupled helicals with the coils tuned far away from resonance, the insertion loss of the coupled circuit then becomes very high, but the size of the hole hasn't changed at all. What's changed is the nature of the circulating currents around the hole.

>Come to think of it, I've seen HF coils doing a good job of coupling
>to each other.

That's different too. The coils are electrically of a "length" approximating the wavelength of the energy while being much closer physically than a free space wavelength, so the magnetic coupling can be a fairly good match. With waveguides and apertures, it's best to think of them as structures interacting with EM waves, but with mutually coupled coils, it's best to think of them in terms of transformers, with separate near field magnetic and electrical components to the energy. You can tap one or the other without much regard for the overall EM wave behavior. That's generally not true for waveguides. We talk of E-field and H-field coupling with them too, but we can't really treat those fields as near fields.

The above needs a lot of qualifiers to represent anything approaching quantitative real behavior, but should be sufficient to give a qualitative feel for what happens. Using waveguide beyond cutoff models for determining the efficacy of perforated shields is too simplistic. Other factors come into play.

>have AM & FM operating modes. Questions...
>1. Does this mean that they work on the "repeater/no-code"
>frequencies(2m/144mhz/440mhz) ?

No. HF rigs are HF rigs i.e. below 30MHZ, unless they specifically state they come with a transverter (which converts 10 Meters to another VHF/UHF band, usually an external unit. FM is included in most HF rigs for the purpose of using it on the 10 meter FM band (29.5-29.7).

>2. Will I then only have to buy one HT for the above mentioned freq.'s so
>I can talk to my wife at home(on the HF rig) while I use the HT(or vice
>versa) ?

No, each of you will need a radio covering the band you wish to use unless the unit states it covers the band in question. The only band I have seen included in HF rigs is 6 Meters on a handful of them.

>Terry KF9HI
Hello, Terry, I saw your note and thought I'd reply...although I am
not an owner of an OMNI-VI, I do own an OMNI-V and feel like I can
make a few comments about basic performance comparisons...

I have (in addition to TONS of Boatanchors) several rigs connected up
to a remote coax switch at my operating position...I have an FT-990
with all the filters, a Drake TR-7, a well maintained Drake C-line, a
pair of Icom receivers, the R70 and R-71A, and the OMNI-V.

I am able to instantly switch between radios and compare the relative
merits of each one and of all the above mentioned radios, the OMNI-V
shines brightest.

I recently monitored very weak CW signals from RS-15 ...I have always
thought that the FT-990 was probably the best high band
receiver....WRONG, the OMNI-V was much better, even with the second
IF's narrow filter cascaded in-line...

I have also opreated in 2 RTTY round-ups with the FT-990 and did not
compete this year due to an amp failure, but, 20meters in the middle
of this contest will let you find all the weakness in a rig...I use
the 250Hz filter and a monitor scope to tune sigs in during this
contest...the FT-990 can, under this extreme circumstance, exhibit
phase noise....that's the only explanation that I or several
technically astute hams have been able to come up with...
I did not get the OMNI-V in time to use it this year in the round-up,
so, I didn't get a chance to see how it did.

On voice, I like the OMNI-V much better on 75m than I do the FT-990,
it's AGC action is superb and I usually operate it with the attenuator
engaged and the RF gain down about 40%...it's almost like FM....

The OMNI-V I have has the 2.4, and 1.8 kHz filters installed along with a 250 Hz filter in the Narrow position. I also have a Timewave DSP-59 hooked up to this radio.

I know this post was not on the OMNI-VI, but, the OMNI-VI is an evoloution of the OMNI-V, not a revoloution, so perhaps my comments will add a little "fill" into other comments about the radio...

I have had the FT-990 for a little over 3 years, the OMNI since January and the OMNI is my favorite rig to use. I don't think that you can go wrong with Ten-Tec, their factory people are second-to-none and really seem to care about their customers.

Just a few of my thoughts, Good Luck and Have Fun!

SAR VOLUNTEER? GREAT!
According to my Bendix-King catalog, the model EPI1541A covers the 136 to
160mhz band. It should therefore be able to program in 2m freqs readily, in
the same manner as any Public Service band frequemcy. BK offers software and
an RS232 cable for programming the radio at $15. The software may be down
loaded for free from the "Technical Service BBS". But the catalog gives
no phone number for it (drat!).

I found the people at BK very friendly and helpful. Try contacting direct:
BK Radio, Inc., Bendix/King Mobile Commincations Products,
2901 Lakeview Rd., Ste. 100, Lawrence, Kansas 66049
ORDERS 800-523-5955, TECH SERVICE: 800-733-2633, FAX: 913-841-0287

6453. Looking for Ten Tec HF hisory / information

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-18 00:00:00 UTC
From: fitr%mimi@magic.itg.ti.com
Message-ID: <3ufm88$np2@tilde.csc.ti.com>
Source record: 215074

Hi All. The recent article and threads on the TenTec Gear got me thinking about trading up to a TenTec.

Now the question. TenTec does not advertise as heavily as they once did in the ham magazines. Aside from the Scout, I've no idea what the current model names and model numbers would be for their currently available radio's. A while back, TenTec was making the OMNI rigs for coverage of HAM BANDS only. The PARAGON rig had the general coverage stuff included. I also recall the ARGONAUTS and ARGOSY's were the QRP entry. Now the SCOUT is the field/Mobile entry. Also thrown in there was the CORSAIR (several models, I presume). I have no idea what the difference was nor the "best" ever built. BTW, my interest is HAM BANDS only and SUPERB CW performance if that helps.

Could someone with working knowledge of TT post a brief discription of the various TT rigs through the ages...or at least the current production models? It would be most helpful...rec's and any idiosyncracies about TT are appreciated too (like the rumor that you must have a special 18 amp circuit breaker in the power cord to run a TT in a mobile).

There is one HF rig that Joe may not know about. ICOM's IC-706 is
suppose to be 100w on 160m-10m (HF), 100w on 6m (VHF), and 10w on 2m
(VHF). This is the only tx I've heard of that will do HF and 2
meters. Unfortunantly, it is not yet availble in the US. According
to my local candy store it will be released in Aug-Sept for arround
$1300.00 but both the date and price are still rumors at this point.
I'm looking for my first HF rig, and this might be the one. If anyone
knows any more about it, please post!

6462. Yaesu service

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-18 00:00:00 UTC
From: "James A. Storm" <jastorm@ix.netcom.com>
Message-ID: <3ufq2k$8gv@ixnews4.ix.netcom.com>
Source record: 215125

My experience with sending an FT-5100 to Yaesu for repair was quite good. They called me long distance as soon as they had an estimate and followed up with a card. They gave me an estimate of $135 plus or minus 10% and a repair time of 4 weeks. I received the radio back 17 days after it was shipped and the charge was $115. They replaced the microprocessor, 3 lamps, 2 transistors, and of course, the lithium battery. Parts were $59 and labor $50, plus tax, shipping, etc.

On the same date, I had sent an Icom HT for repair. According to UPS tracking it was received within minutes of when the Yaesu was received and on the same date. They didn't call but instead sent a card. A call to them only got me the message "All our representatives are busy at the moment." Although I have authorized whatever repairs are necessary via snail mail, I still don't have a firm estimate. We'll see how it all turns out.

Meanwhile Yaesu service stands pretty tall in my book.

> Does anyone have any mod's for the HTX-212. This is Radio Shacks
> mobile 2 meter rig.

Yeah, let's see.... Throw the radio on the ground and stomp on it.
Reshape it with a large hammer.

Are you fully capable of repairing anything that can possibly go
wrong with the equipment? I'll bet not. Then WHY do you- and not just
you personally, now... but everyone who wants to modify their new
radio... want to run right out an modify it. Why didn't you get a
radio that could do what you want in the first place!

Seems like folks are very willing to modify a piece of equipment that
they can't repair, therefore do not have the capability to modify
either. Just ask any tech who works for ICOM, Kenwood, Yeasu etc
about all the modifications they have had to straighten out. And
that is if the radio were not boogered up to unmodify.

Your radio, do what you want. BTW, do you have a LICENSE to use that
radio ????

Source record: 215129

Fritz, The reason 572B's got so expensive was because Richardson's Electronics bought all the manufacturing facilities. They jacked the price up to an unreasonable amount, like they do with everything they take control of.

But now there is good news. The Russian and Chinese manufacturers are making 572B's at a reasonable price. If you shop I am sure you will find them. Then you will not have to suffer with the smaller 811A, and not get robbed in price by a monopoly in one manufacturer-distributor. 73 Tom

6467. Re: COMMENTS ON RUSSIAN/CHINESE TUBES?

From: w8jitom@aol.com
Message-ID: <3uggvo$f8u@newsbf02.news.aol.com>
Source record: 215130

I have evaluated both tube sources in extensive testing. There is a great difference in the 3-500Z tubes made by Eimac and China, the Chinese tubes are very very poor quality. The typical six month failure rate of Chinese 3-500 tubes was almost 80 percent!

With the 811 type tubes the difference is much more subtle. I would not worry about using Chinese 811 tubes, although the Russian 811 tubes are generally better quality.

> know they are being used in your area, though, thats another
> story...
> >

I would agree here. The only time my laser detector has ever gone off
was when I was approaching Denver Int'l Airport. It must emit some laser
type pulses for the aircraft or something. I never have heard it go off
besides then. X and mostly K and Ka will still be the most widely used
because of the simple fact that they can be used from a moving source and
have a lot less stringent requirements about angle and such. For those
of you who don't know (courtesy of my Escort radar detector manual) laser
guns are only accurate from a stopped position, and preferably a straight
line to the target. That's why you usually only have to worry about being
tagged by a laser by a bridge overpass, as that's where cops like to set
them up. Radar, on the other hand, can be used while the cop is moving.
Another obvious point is that laser can be scattered very easily and so
any fog or rain in the area will cause enough inaccuracies that you will
not have to worry about laser detection in that area.

As a side note, this manual of mine states that radar pulses are usually
around 18 feet wide when it hits its target. From this it's obvious why
so many other cars can detect the same signal since it would hit more than
just the target on the road. Laser (if I recall correctly) spreads out
significantly less, more around the range of 4 to 6 feet. Often it's too
late to do anything once your laser detector has gone off. Of course,
you could get one of those laser-absorbing license plate holders... 8)

Just my $0.02.... now back to CBs!

-Chris

: 73's Mike KS4DA (Green COve SPrings, FL)

I have been using a 751 for five years and it is working just fine. If you are into the digital modes, do not get the 250 Hz narrow filter because it is indeed too narrow. Get the 500 Hz. I would strongly suggest that you spend the extra money and get the 455 kHz IF filter as the skirts, as claimed by Icom, are steeper. I would also recommend the 6 kHz AM filter for SWBC listening.

I hope you have success with the radio. Give me a call anytime you see me on the air and we can shoot the breeze.

73 and live better digitally

From: ja@coe.wvu.edu
Message-ID: <DBwA18.4tw@cerc.wvu.edu>
Source record: 215134

First of all, sorry if this is not the place for such questions, if it is not point me to it, these are not my usual net stomping grounds. Now for the questions, after 30+ years as an engineer for various radio/tv stations while working for AT&T dad finally recently got his no code license and was looking for a reciever, years ago he had his own TV repair business and he has collected a lot of stuff including 3 or 4 Hallicrafter receivers so I suggested he look into using them, the newest an SX-71 (or 78 can't recall) is operational and in nearly new condition and he has started using it regularly though it needs some alignment, the two older ones are a S20R and a very old model with black bakelite front panel bearing only the the name Sky Challenger on the tuning dial, the two newer are complete the Sky Challenger is missing a few knobs and one transformer has been removed and replaced with an odd replacement unit. Anyway we had the manual for the newest, but have misplaced it, and never had manuals for the others so I am looking for information about the recievers, their vintage, and copies of manuals for at least the older 2, if anyone could help it would be most appreciated.

Thanks
John

I have a pair of FT-470 HT's. They had not been modded for
the intermod reduction, as Yaesu has been doing for free...

I was told it was about a 3 week turnaround on them.

I sent them out UPS 3 day on 26 June.
They were received by Yaesu on 29 June.
They were shipped back to me, modded, on 6 July.
On 9 July, I received them.

Three days later, I got a pair of postcards saying I should
be getting the radios back within a week or two. :-)

Good service.

Source record: 215136

I have an Dentron MLA 2500 Amplifier and I am having some trouble getting in wired up correctly... I was wondering if anyone could offer some help.

I would like to wire it for 117 VAC at this time but I can't seem to find the power network assembly where you are supposed to be able to change some jumpers to allow for this (the power network assembly is supposed to be at the rear of the amplifier for easy change without removing the cabinet)..On the rear of the amplifier on the panel it does show 1 | | but there is supposed to be
2 | | something like this -----> _____________
--> 3 | | somewhere with jumpers | |
4 | | | 1 |
5 | | 3 jumpered to 4 ---> | 2 |
6 | | for 117 V | |-3 |
| - 4 |
| 5 ||
| 6 |
| |

The amplifier is supposed to be wired for 234 V at this time but I would first like to try it at 117 V if possible...

Thanks for any help anyone can offer,
Tom Fuller KE4QCM

6474. Hiss in IC-736

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-18 00:00:00 UTC
From: KF5KF
Message-ID: <3ugpfb$ljm@giga.bga.com>
Source record: 215137

I bought a new Icom IC-736 and it has a hiss sound in the speaker output, even with the volume completely down. It actually covers up a weak signal. I called Icom and the tech said that is normal. Is it??

Anybody else have one with the "hiss" sound all the time. With the volume up, you never know its there, just with the volume down or with earphones on.

Thanks,

Bob Redoutey KF5KF

No, the type of modulation and the frequency of operation are two entirely separate things. While SSB, digital, and CW are the most common HF modulations, FM is used on the upper part of 10 meters, and small amounts of AM operation can be found on both 10 meters and 160 meters, with even rarer usage on the other HF bands. So HF rigs commonly have AM and FM capabilities built in, but they are still only HF rigs and don't cover the bands above 30 MHz where Techs may operate.

The only current HF rig that covers VHF too is the FT-767, though Icom has a new rig called the IC-706 that will cover 2 meters, but it hasn't been released yet. Several of the HF rigs on the market include 6 meters, which a Tech can use, but finding a HT that will cover 6 meters is going to be a problem. Unless you want to spring for the FT-767 (expensive), or wait for the new Icom, then I suggest you'll have to buy a separate VHF rig for the house. That's not a big deal, several inexpensive models are available.

Gary

>be on the WEB.
I haven't seen a specific Collins newsgroup, but I would be interesting in
joining one. I just ordered a "brand new" 180S1 antenna tuner. I saw an ad
in QST and I know a friend who bought 4 of them. The person bought several
hundred in a military surplus sale (I think), and is selling them at a good
price. I don't have a station yet, but for $295 this was too good a deal
to pass up on. Do you have any information on the Collins net on 20m? I
am hoping to have a rig and antenna by the end of next month and I would
be interested in joining.

Thanks.

I have a friend that used his on digital modes. Evidently, there is
a wierd connector on the back of the radio that you will have to
wire up to the TNC. What I understand is the connector is
hard to deal with. However, you shouldn't have any problems
running it in the digital modes.

WT> find them. Then you will not have to suffer with the smaller 811A, and
WT> not get robbed in price by a monopoly in one manufacturer-distributor.

Suffer with the smaller 811! I built an amp for 160-40 that
uses 4x811A and I didn't suffer, much. It only needs 12.5w drive
per tube and needs NO input circutry to match the solid state rig
to the tubes. She's good for +700W out too, better than 10dB gain.
I used the Soviet tubes and have about $150 in the whole mess. By the
way, I obtained a set of 811's (very used) for free at a local hamfest
a few months ago that each tube had holes burned in the plates and one
even had a hole in a grid. I put them in for fun (stupidity?) and it
would still kick out 450W with IMD'z down about 40dB! Good tubes.....

Phil, KE4KRT

Hi

With all the talk and swap re. Motorola HTs, it would be interesting if some kind soul could post some info on the various HTs, in or out of production on the used market. Also, why use Motorola HTs when they appear to be limited to 2 - 6 channels as is common in commercial and public safety sectors, require factory programing, etc? I know they are excellent products, but they don't seem to be as versitile as new ham HTs that have hit the market in the last few years. I suppose they are good if you only work one to a few of the same repeater freqs.

Thanks for the info.

Bret: I use the HTX 202 for packet with a KAM tnc. The KAM works
simultaneously on HF and VHF. The KAM came with the necessary cables
and I only had to add a resistor and capacitor in the cable at the
HT mic plug. The instructions for hooking up either an ICOM (02AT
style) or Yaesu will work but it is necessary to use a 2.2K PTT
resistor for the HTX202.
It works well for me.

I am thinking of purchasing a Hal ST-8000. I have a Kam+ and a Hal 4000/M board which will be upgraded this fall. Anyone with experience with the ST-8000??? How much better than the Hal 4000/M? Incidently I have been using a Timewave DSP-59+ with the Kam+, using version 3.0 and DSP remodulation of rtty signals. It now copies rtty al least as well as the Hal 4000/M, in my opinion. Irun both in DOS windows under windows 3.1 and can compare the RX performance.

>
Sarah:
I have a mod but haven't tried it yet. I also don't know exactly what
else it may do, for example, it may limit the high end. From the
schemetic, you need to connect a 22K resistor from +5 volts (pin 44
of the control microprocessor I1), to "Aud Pwr" (pin 21 of the control
micrpoprocessor). Without an illustration of the circuit board, I
don't know how I could describe the locations.

Hope that helps.

6496. FT-530 800 MHZ *REQUEST HELP ***

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-19 00:00:00 UTC
From: Scott Rider <scott_rider@ccm.jf.intel.com>
Message-ID: <3ujhqk$iee@news.jf.intel.com>
Source record: 215010

Readers,

As you all probably know, the newer generation FT-530s
when "modified" do not receive the 800 MHZ bands.

I found out why and want to do a simple check before I
publish a new "MOD" to upgrade the FT-530s to recover this
"feature".

It appears to be difficult, by the way, so I want to check
the "foreign" versions. We may be able to buy the needed
part from the factory instead of performing micro-surgery
on the units.

REQUEST: Users in UK/Europe and Canada, please let me know if
the easy mod on your FT-530s (clip green wire or jumper) will
allow 800 mhz reception (not just in display).
Or IF YOU KNOW WHAT YOU ARE DOING, please tell me the component
count on the backside of your V&V Local Unit PCB. I will also
need the first 4 numbers of your serial number to check the build
lot.

Reminder, this is not intended to be a set of instructions to
do anything with your radio that you should not do. I will not be
responsible -or even sorry- if you break your unit because you
opened it to help me.

Thanks,

Scott Rider

$1000 still seems rather steep for a dual band comerical radio. I was qouted
$1549.95 by a local dealer. At that price, he has yet to sell one and has
been trying since it first came out. This shop sells dual and twin band
radios by the box full into Mexico. Now if someone would just come out with
something I can afford...

I'd definately be interested in more information on this new Motorola handheld that is field programmable.

Traditionally, Motorola has defined "field programmable" as something that can be programmed in the field, by a dealer with a cable, RIB, computer and expensive software.

Others, like Icom and Bendix-King have defined "field programmable" as something that can be programmed via the keypad on the radio.

Obviously I prefer the latter....

hkgreg@aol.com (HkGreg) is trying to put one of these old
Sideband Engineers rig back in operation.

I never had one of these, and don't have a schematic or manual
for it. Just a couple of points.

There was also a SBE34; it came out after the #33, and don't know
whether it was a better seller. I do seem to recall that the #34
had more features, maybe even more bands. It might be important
to keep in mind, because just maybe the two rigs are close enough
in detail that you can get by with a #34 schematic.

There also have been a few articles in the ham mags about improving
these rigs. From what I remember, they were fairly rudimentary rigs,
and seemed to be ripe for little mods.

There might have been something in 73 at one point, but what I
am remembering is at least one, maybe two, articles in 73 on
modifying one or both of these rigs. They may not be worth
a lot of effort tracking them down, since I don't recall complete
details. Anyway, there was a quite extensive article by John
Schultz, W2EEY, in CQ towards the end of 1968. I think it was;
the cover I remember had a blurb about the about to be implemented
incentive licensing. At some earlier point, there was an article
by Katashi Nose, KH6IJ I think, on adding CW, I think to the SBE33.

YOu might also do well to track down any possible equipment reviews
for this old rig. Check old CQ's, that seems to be the most likely
place, and perhaps QST. These might unvail a few important first
bits about these rigs.

If you can collect enough information this way (be sure to find
an add for the rig), maybe you can get by without a manual or
schematic. It depends on what exactly needs to be done with the
rig.

6502. HF Rig, Which one?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-19 00:00:00 UTC
From: msl7k@virginia.edu
Message-ID: <DBxxst.8z7@murdoch.acc.Virginia.EDU>
Source record: 215016

I have had a TS-850SAT, TS-50 and a IC-735 in the recent past. At this time I do not have any HF equipment at all. I am getting the itch to get back on HF again. I have looked at the little Ten-Tec rig that you buy the $29 modules for each band you want to work and the $549 price tag looks good. I want a small rig that would feel good at home and on the road in my camper. Give me your opinion on the rigs you feel I should check into.

Thank you
Ed

I am attempting to extend the RX range of my FT-2400H to
118-174mHz. I have unsoldered j2, as j1 & j3 had previously been
soldered.....What now? My radio will go down to 118mHz, but
nothing is to be heard fm 118-136mHz.....Tnx

6504. HF Rig, Which one?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-19 00:00:00 UTC
From: msl7k@virginia.edu
Message-ID: <DBxzA0.9Iw@murdoch.acc.Virginia.EDU>
Source record: 215018

I am looking for a small HF rig. I have had a TS-50, TS-850SAT and a IC-735 in the past. I would like more information on the Ten-Tec rig that uses the plug in band modules if you have heard anything about it. I don't do a lot of HF work but would like to get back on the bands in a month or so. I did not listen outside of the HAM bands on the 850 so I don't need general coverage. Small size is a factor for me now as the spare bedroom (old ham shack) is now in use by my 5 week old son!

Thanks for your response.

What a person decides to do with his equipment is his business. Some people are not satisfied with the performance of the gear they buy. Lets face it, manufacturers put out a lot of crippled crap that can do more than packaged. If a tweak here and a snip there will do it, why spend more bucks on a rig that will. Not everyone has an unlimited budget to spare for their "hobby".

BTW do you have a license????

>73's Mike KS4DA (Green COve SPrings,

You don't indicate if you are looking at the 751 or 751A. The 751 had a number
of problems that were solved in the A model.

If the price is not to high, and if your needs are only general hamming, the
751 may work well for you.

However, if you are a bit more discriminating, and especially on CW, then
I would be careful to make sure that the rig is the 751 A model.

Check out the new Alinco HF+6 m, mobile. I've heard good reviews.
Also if you are willing to wait a couple of months, Icom is coming
with an HF+6m+2m mobile! (IC-706 I think). I personally have a Yaesu
FT-890AT and even though is not as small as the above I like it very
much. You could get one of those used for under $1,000.

Message-ID: <3ujlka$lsh@nntpd.lkg.dec.com>
Source record: 215024

I have a TH79E that has an intermittent fault that causes the display to go blank. The transmit and receive functions continue to work fine, it is just the display. I can get the display back by turning the power/volume control off and then on again.

Is this a well known fault, and if so what is the fix?

>Just wondering.

Scanning the cellular frequencies is, of course, a violation of the
ECPA, which is enough reason for some lawless persons to want to do
it. The attraction for others is obviously the ability to be the radio
equivalent of a Peeping Tom. Some people are just fascinated by the
mundane details of other people's private lives.

I have an FT-51 and it's a very fine rig. The ability to program the memories via your computer make it an overwhelming favorite in my book. (Keypad programming is just too tedious for my tastes. Besides, to quote The Beavis, it's cool.)

That said, the '79 is also a fine radio. I don't think you can make a wrong choice here. Take the one that has the features you want and that you like the look and feel of.

>Dave Baker - AA9OQ

The connector is question is a 13 pin DIN plug, common on a number of Kenwood radios. They're available from a number of sources, and you can always find someone who has them at hamfests.

They're a pain in the butt to solder to, given the number of wires needed for most multimode controllers. A small iron helps.

The 140 will work fine on Pactor, Amtor, whatever-TOR.

CHARTER

Rec.audio.tubes is dedicated to the discussion of vacuum tube
audio equipment, including the following topics:

* hi-fi applications
* guitar (and other instrument) amplifiers
* radio circuits
* theory and design
* vintage and modern equipment
* repair/modification/restoration
* purchase recommendations

Participants from all backgrounds are welcome. Polite expressions of
opinion are welcome. Personal attacks and flame-wars are not. Let's
keep things civil, informative, and fun.

RATIONALE

Although the transistor and its relatives have largely replaced vacuum
tubes in modern electronic products, there remains a substantial set of
people who, for various reasons, use tube (or "valve") equipment,
and there remain many companies which produce such products. There are
also a great many "vintage" audio products of various types which often
need to be modified, repaired or restored. There are a number of
special issues associated with tube electronics that are not of concern
to most users of audio equipment, and there is currently no one place
for discussion of these topics on the Net.

HOW TO VOTE

Send MAIL to: voting@legion.central.sun.com
Just Replying should work if you are not reading this on a mailing list.

Edit the ballot below so that your mail message contains one of the following statements:

I vote YES on rec.audio.tubes
I vote NO on rec.audio.tubes

You may also ABSTAIN in place of YES/NO - this will not affect the outcome. Anything else may be rejected by the automatic vote counting program. The votetaker will respond to your received ballots with a personal acknowledgement by mail - if you do not receive one within several days, try again. It's your responsibility to make sure your vote is registered correctly.

Only one vote per person, no more than one vote per account. Addresses and votes of all voters will be published in the final voting results list.

I need a tiny Win.3x database that can handle between 5K to 10K dataposts
with 10 fields each.. Can anyone tell me where to upload such a base ???

please e-mail me if you can help :-) espen@radio1.no

6529. which GMRS or PLMR unit?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-19 00:00:00 UTC
From: gsk@khaki.esd.sgi.com
Message-ID: <3uirlk$oq6@gazette.engr.sgi.com>
Source record: 215094
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment

please help me shop for a pair of gmrs or plmr units.

- are there any comparative reviews available?
- has anyone out there done their own comparisons?
- which specific models do you recommend or not recoomend,
and why?

- what's the difference between gmrs and plmr?

- is there any reason to prefer a unit sold specifically for
gmrs/plmr or a unit that can be programmed for those frequencies?

- can you recommend a good mail order source or retail shop
in the s.f. bay area?

i'm interested in using them for outdoor activities
like hiking, fishing, etc. and for personal use in a
suburban setting. range, weight, audio quality,
durability, features, and price are all of interest.

any info would be appreciated.

thanks.

6532. Re: ICOM 751 good rig?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-19 00:00:00 UTC
From: jjo@tekla.fi
Message-ID: <JJO.95Jul19132625@ds10.tekla.fi>
Source record: 215097

I have had IC-751 for several years. I have tested the radio against
several other radios by listening contests etc. and switching between
the radios. I also have made some measurements but I have not had
particulary good measurement equipments, so one can not really trust
to my measurements.

The overall picture, however, is as follows:
- as with just about any modern radio the IC-751 has pretty good
dynamic range and sensitivity is good
- as with just about any modern radio, the SSB filters are poor, the shape
factor is about 1.7 as claimed, after the -60 dB point the filters
deteriorate rapidly, i.e. ultimate rejection is poor, therefore nearby
stations cause unnecessary interference
- I should, however, point out that the filters of IC-751 are slightly better
than the average filters in common radios
- QSK is too slow on IC-751, this has been corrected in IC-751A

One, more thing. There are vast differences between the original IC751 and the IC751A. The QST reviews, as I recall, pointed out some problems with the IC751; when the 751A was reviewed, the comment was made that it was almost a different radio.

Source record: 214952
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.digital.misc

I'm trying to determine which TNC to purchase: the Kantronics KAM+ or the MFJ-1278B. I like to MFJ because of the Color SSTV support, and I like the KAM+ becuase its dual port.

My interest is mostly digital sat work, downloading telemetry info and pictures.

Any recomendations/opinions/experience with either is appreciated.

Thanks,
Kory

I don't own the 202, but have a few 404s and know people who have remarked on the heating problem with the 202. Basically, any of these handie talkies, from RS or anybody else, are liable to over heat when doing a lot of transmitting at high power. My Icom IC-32AT had this trouble. Installing the metal belt clip improves the quality of the heatsink by providing a big fin for air circulation. To improve on this further, add a thin layer of silicon heat sink grease between the belt clip and the heat sink (the back of the radio). It will much improve heat transmission from the heat sink to the belt clip. I experienced good results with this method, as have several folks I know. Better still: When you can get by with less than Full Power DO! The toy will live much longer and happier!

The S20R is of late approx. 1938 vintage the sky challenger is about the same
age. The SX-71 is a very good radio, popular receiver in the mid 50 s to mid 60
s. Manuals for all are available from HI Manuals, you have to look in the back
of the latest QST for the address and the latest catalog number.

I have an S20R myself and it is a neat old radio to play with but it isnt as hot as todays rigs. Enjoy the SX-71, I wish I had one too.

- -

I have zero desire to monitor cellular freqs but it annoys me
that the frequencies are *blocked* on most (if not all)
equipment. People who use cell phones should be made aware
that their phone is a radio transciever and they should
automatically consent to monitoring when they use a cell
phone. Just because 9.5/10 of Americans are too ignorant to
understand how cell phones work doesn't mean laws should be
made to shelter stupid people in their own ignorance.

I say allow unlimited monitoring. After someone makes a
credit card transaction over a cell phone and gets a huge bill
the following month, they'll start thinking about what's
actually going on when they flip that phone open.

Laws should force ignorant people to think, not hobble those
who already know how.

From: peterjs@aol.com
Message-ID: <3ukppm$qub@newsbf02.news.aol.com>
Source record: 214963

Does anybody out there have a Cushcraft R7 vertical? I have one
about 12 feet up attached to a chimney and am running with a Kenwood
TS-450S-AT. Despite my best efforts at adjusting the length for 40M,
I can't get an SWR reading under 3. Likewise, the AT on the TX doesn't
seem to help much and in fact, I only discovered something was amiss when
I put an off-board SWR in line and noted the high SWR while the SWR
reading on the TX showed 1.1 (or so). Anyway, any suggestions for how to
get 40M working here ? The other higher frequency bands seem to get
better SWR's (all less than 2.0) but it seems pretty hopeless for 40M.

6549. TS 940 / thermister testing?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-20 00:00:00 UTC
From: turner@safety.ICS.UCI.EDU
Message-ID: <17721.806214574@safety.ics.uci.edu>
Source record: 214965

I have the Kenwood TS 940, and I am slowly working it over.

I have replaced the fan in the power supply, it had failed by stopping spinning even when voltage was applied.

Now, there is a second cooling fan in the 940, in the final unit. I have worked CW at full output for a couple of minutes until the top of the cabinet got slightly hot to the touch, and figured the fan should have come on. The fan in there seems harder to get at, and I haven't gone in there yet.

Is there a way to test the thermister easily for the right specs? Are thermisters easy to come by and/or cheap? I might replace it with one that goes on at a lower temperature, or set the circuit that way anyway, if it is easy.

I plan to bypass the thermister to turn on the fan circuit to see it all the rest is working, then I will wonder about the thermister itself.

Any comments or suggestions?

6550. Re: Deaf R7000 above 1Ghz

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-20 00:00:00 UTC
From: hcb@phc.chalmers.se
Message-ID: <3ul0am$21r@nyheter.chalmers.se>
Source record: 214966

The obvious things coming to mind...
(1) Check that the 1GHz converter is switched in properly (voltage at relays etc)
(2) Check your DC-DC converter in the PS. The capacitors tend to fail in older rigs. This leads to all kinds of strange behaviour, including 'deaf' rigs. Mind you, that should affect all bands (since the filter switching doesn't function properly).

Good luck,
/hcb

Greetings ..... my recently deceased grandmother (WA7FFG) has left her old Collins 32S-1 and 75S-1 to me, along with a Ten Tec Triton II. The rig was originally purchased around 1959 or 1960 by my grandfather (K7OQY). For purposes of estate taxes, I'm trying to determine the value of these units. Everything is in pretty fair (average) shape and I'm assuming that the combined value of the Collins rigs is around $250 and approximately $175 for the Ten Tec. Does that sound about right?

Thanks for any comments/guestimates.

Warmest 73
Sandy

I just heard from a reliable source that he has seen a FT51R that has 800 RX. Also, I recently spoke to a YEASU tech support person and was told that the mod exists (as a combination HW & SW mod). Has anyone got information on this mod? The YEASU guy said that it provided capabilities similar to the FT530 mod that involved snipping the green wire.

Alas poor Dorr welcome to the world of MFJ, Other wise known as
Mississippi's Finest Junk. I too had an earlier MFJ memory keyer which
developed problems (switches) after only 4 months of use. In general MFJ
has a long standing reputation of shoddy workmanship practices. I had to
get burned 3 times (Memory Keyer, Antenna Tuner, antenna analyzer)
before I learned my lesson, all had substandard (or you get what you pay
for) components, loose hardware, and poor solder (hand solder) connections.
Just my opinion, good luck :-)

Kirk,

They are pretty nice radios. If you are familiar with the full display MT-2000, they look like those. Has the features of a HT-1000 16 Ch. They are "kinda" field programmable. You must buy a "KEY" that attaches to the side and know the password for the radio, but other than that, seems much better. I've got a couple ordered to see what we can do with them.

CARL
And I thought it was just ME having hard times!!!!!!!!!!!!!!!!!!

> anyone inform me of what the story is (if any)?

The tuner is an optical encoder the early ones had an imperfect
seal. Dust would get in them and they would not tune reliably.
Yaesu retrofits the 2400 with a new encoder that has a double
seal. The feel is not as nice as the original but it works
properly. I don't know what serial number the new style was
used from perhaps some one else can help.

In a previous article, Chris.Murphy@Symbios.COM (Chris Murphy) says:
>
>I would agree here. The only time my laser detector has ever gone off
>was when I was approaching Denver Int'l Airport. It must emit some laser
>type pulses for the aircraft or something. I never have heard it go off
>besides then. X and mostly K and Ka will still be the most widely used

In Ohio on Rt. 2 between Cleveland and Sandusky the cops use so much laser
it seems like you are in a Star Wars movie. They just bought a bunch of new
laser guns recently so there will be even more laser in Ohio in the future.

6558. HP3047 phase noise software wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-20 00:00:00 UTC
From: jks@pajarito.sw.Central.Sun.COM
Message-ID: <3umhgk$1v3@handler.Eng.Sun.COM>
Source record: 214974
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew

I've acquired the phase noise interface (HP35601) from an old 3047 phase noise measuring system, but a complete system requires the 3582 and 3585 spectrum analyzers and a 9845T calculator (!) running special software. I'd like to hack the 35601 to work with my 4396 analyzer running IBASIC, so a few questions crop up:

Anyone have the 3047 measurement software? (tape cartridge for 9845T) Anyone know if it's distributed as source code (probably BASIC) or just binary?

If binary, does anyone have a pointer to the group inside HP that wrote the code? (probably early 80's)

If source, is the tape format compatible with anything modern or will I have to find a 9845T (ugh) to read it?

Ditto the above for anyone running the modern 3048 system.

It sure would be nice to measure down to -170 dBc/Hz @ 10 Khz for a change..

Source record: 214978
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment

Hello and thanks for reading this posting. I am in the process of building a repeater controller and a link controller. Both of these controllers need to have remote acess to the repeaters so that I will be able to shujt the system down and/or controll links as needed. Of course this will be done with DTMF tones, and to do this I need several DTMF decoder chips. Silicon Systems makes a SSI-202 chip that will do the job very nicely. Now you say there are all kinds of suppliers of DTMF chips, but, the problem is that most of these new chips are all microprocessors, and not what I want. Here in lies the problem. Where can I get a supply of these chips. I would prefer to get them iun Canada, but if needed I would go to the U.S of A. Any help would be greatly appreciated not only by myself, but from the members of the TRI-County ARC in Moncton New Brunswick Canada.

Please send reply to mallorys@nbnet.nb.ca

Stewart,
This is a known fault and it has to do with a bad VR303.
This VR is for adjusting the contrast, just clean the carbon layer.
Also check the voltage on TA, wich must be about -1,6Volt.
this Testpoint is on the left lower edge of the control board, to
reach VR303 you must remove the control board because this VR is on the
other side next of the LC unit.

Hi.

HE>I am thinking of purchasing a Hal ST-8000. I have a Kam+ and a Hal
4000/M
HE>board which will be upgraded this fall. Anyone with experience
with the
HE>ST-8000???

I've had and used an ST-8000 for several years. It works extremely
well
and was measurably better than the KAM I used to own, or the PK=232,
the
Dovetron MPC1000R, or the AEA ATU-1000. The guys at Hal told me at
Dayton the 8000 is the best unit they make, even better than the
newer
units, tho I have no personal experience with the 4000 and other
boards.
I did have a Timewave here for a few days, but was so disappointed
with
its sideband performance I never checked the rtty operation.

The combination of filtering and controls does dig signals out of the
QRM better than anything else I've used. How much of course is hard
to
say, since conditions constantly change, but you will be well
satisfied
with one. I like the control aspect - some guys are a little off
frequency, and all you do is spin the knob and you've peaked
everything
up. Also, you can just start out, say, with the filters at 200 baud
for
Pactor, but cut it down a bit if needed. If the link goes to 100
baud,
you can crank down the filters and it will work better. You can, of
course, have the computer control the filter characteristics
dynamically
thru the RS-232 connection.

Do not expect to make any use of this on CW. The manual says you can,
but the built-in AGC screws everything up, and a chat with the
factory
confirmed that "it really wasn't designed for cw". This is too nice a
unit for my random tinkering!

I know the above praise will seem a bit self-serving when I say that I
would consider selling the unit I have, since seeing your note makes me
realize I haven't used it in quite a while. I have been using
computers for work-related tasks far more than I would like, and I just
can't get excited about doing more of it in the ham shack. Perhaps you
have a line on one already, and if go ahead, I haven't even considered
selling this one, but if you are looking for one in top condition, with
the manual, I'll take $2,500 for this one.

If you have any specific questions I can answer or look up, let me
know.

6570. UK Repeater logic info Reqd.

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-20 00:00:00 UTC
From: wilson_jo@grpr21.dnet.bp.com
Message-ID: <1995Jul20.040652.2053@rcwusr.bp.com>
Source record: 215033
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

I've recently taken over as repeater keeper of GB3OH, the 70cm repeated located in East Central
Scotland.

The box seems to be working OK, apart from one small problem (and in dire need of a tune-up!).

As part of a club project for a group within the Falkirk Amateur Radio Club, we're intending to get
this repeater back on the air soon, but we lack any information on the system. The TX and RX
sections aren't too much of a problem, but we'd like to get some info on the logic.

It's discrete logic (no processor), and as far as we can tell, of a 1979 vintage. I know the logic
is a copy of some used somewhere in England, so it's not unique to 'OH, although it is possible
the original constructors of 'OH (now slient key) did modify it slightly.

The logic board is about 9 inches square, with a large PCB edge connector to the rear. There are
several presets located up the left hand edge of the board. By trial and error, we've determined
some of the functions of these presets, but we're still trying to figure out the others.

Does anyone have diagrams or any information on something this old? If you have, please email me here, or wilson_jo@grpr21.dnet.bp.com.

In the long term, we're hoping to revame the whole system, but as it seems to be working quite
well just now, we intend to get the box back on the air as it is.

A date for your diaries: 8th October 1995, from 11:00 to 16:30, the Falkirk Amateur Radio Club
will be holding a junk sale in the Scout hall in Grangemouth. Morse tests will be available.
Some of the proceeds of this sale will go towards the upgrading of GB3OH. Further details from myself at the above address.

John.

From the sounds of it all you would be better off to junk the old
controler and just buy a new one... It should hook on easy...
You will spend a lot of down time on the repeter that you and your
gang could have been chatting.....

Does anyone have any knowledge of converting an old TV to a (lousy?)
Spectrum Analyzer ?

My idea is to hook the vertical yoke to the speaker and the horizontal
ramp voltage to the tuner (with a pot or voltage divider between them for
some control).

With a marker I should just be able to change channels to move around the
spectrum and get a 'picture' of it. TV's have decent freq. range also ...
Not a Tektronix $100,000 setup but I should 'see' 'something'.

B/W TV's are cheap enough that I'm willing to butcher one ...
It would be helpful if anyone had tried this before or better yet knew of
an obtainable article on doing this...

Any tips would be appreciated or have I missed some intricacies of
television design that would prevent this from being possible ?

Don't laugh too hard as I only intend to cut a couple of wires and it
should be easy to restore it if need be ;>

6578. (?) IC-738 vs. FT-990?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-20 00:00:00 UTC
From: "Devon G. Crowe" <dcrowe@lpl.arizona.edu>
Message-ID: <3ulrq7$lu2@news.ccit.arizona.edu>
Source record: 215041

Has anyone had the ooportunity to compare side-by-side the Yaesu FT-990 with the Icom IC-738? If you have compared either or both of these with the Kenwood 850, I would also be interested in that information.

I've had radios by all three manufacturers over the years, and they were all good. The question here is the subtle advantages of one over another that would make a difference. Does the Yaesu have a better receiver front end than the Icom?, etc.

Thanks,
Devon

A friend recently purchased an old Cornell-Dublier Electronics (CDE)
model AR-33 rotator Series 1A December 78 at a hamfest, and could
really use some information on how to set up the presets that are
on the control box. Apparently there are 6 buttons for swinging the
rotator to preset directions, but I guess it's not obvious how to set
the presets. Can anyone help with some info that I can pass along?

I just got one and it looks great so far. Keep in mind that you can only
install 2 additional modules for a total of 4 bands. 6m, 220, and 23cm modules
are available, so you'll have to make a choice of which two you want to
install. They're supposedly pretty easy to install and remove, so this may
not be such a big deal.

Up here in Canada we have no monitoring restrictions at all. As long as you do not divulge anything you may hear, you may listen to whatever you please - including scrambled/encrypted communications. However, I really have no desire to listen to cell calls, as the majority of the ones I've heard are quite boring. I have used a scanner to track down some interference caused by a spurious cell transmitter - something that I could not have done with a "blocked" receiver.

My point is that there are more reasons to having an "unblocked" receiver than just listening to other people's conversations!

6585. KISS software bug ???

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-20 00:00:00 UTC
From: dao@mrspock.mt.att.com
Message-ID: <DC12Kw.4p2@nntpa.cb.att.com>
Source record: 215048
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment

Has anyone else observed the following problem when using the MFJ TNC
in KISS mode?

I have two 1270c TNCs, one is about 1 1/2 years old, the other is
brand new. I have observed that both of them will go through a
restart cycle (3 blinking lights) after a period of about 3 minutes
of no input/output activity.

I confirmed this by placing the units in KISS mode, then disconnecting
the radio and stopping the terminal program, ie the units just
sat there idle in KISS mode. I get the same results, regardless
whether the terminal is running NOS, or a terminal emulator,
or just sitting at the DOS prompt, or even physically disconnected.

I reported this to MFJ tech support and they said "oh yeah, we
saw that problem about a year ago and have new eproms with a fix".
So they sent me new eproms, and guess what? No difference.
I guess the fix doesn't work.

Actually the restarts don't usually cause a problem, since the unit
comes back up in about 2 seconds, reloading the parameters it had
stored in battery-backed RAM. However, a couple of times I noticed
that if NOS was sending some data to the tnc at the same time it was
in the restart cycle, strange things might happen - like a total
lockup requiring recovery with a power off/on sequence and a
loss of b-b RAM data. This could be a problem at a remote site !!

So, has anyone else seen this? Is there some parameter or set up code
needed that they forget to tell you about? Was the software designed
to require activity on the comm port? Except for this bug, the
units seem to work very well in KISS mode the rest of the time.

Thanks.

>I bought a new Icom IC-736 and it has a hiss sound in the speaker output,
>even with the volume completely down. It actually covers up a weak signal.
>I called Icom and the tech said that is normal. Is it??

Yes. Either the AF power amplifier IC they're using just plain has too
much idling hiss, or they've got its gain set so high that it
overamplifies its own noise or the output hiss of the
bipolar-junction-transistor low-pass filter stage that (ironically)
precedes it. The IC-736's AF gain control precedes the filter stage
and (obviously) the AF power amplifier, so it can't affect hiss
generated in these stages.

From: kory@avatar.com
Message-ID: <3um83k$h2b@avatar.avatar.com>
Source record: 215051

I'm looking at buying a DSP and after a lot of research, I still can't make up my mind which one to buy. I've narrowed my choices down to the following units:

TimeWave 59+
JSP NIR-12
MFJ 784B Super DSP

I am favoring the MFJ unit since it seems to be the most flexible, but I'm not sure about quality.

Any comments or experiences or why I should buy one over the other would be greatly appreciated.

Thanks,
Kory

From: jjo@tekla.fi
Message-ID: <JJO.95Jul21083005@ds10.tekla.fi>
Source record: 214904

I have had the opportunity to run FT-990 against several radios,
IC-738 being one of them. I did not have any measurement equipments so
my opinion is based solely on what I could hear. The shape of the SSB
filters of FT-990 were, on my opinion, slightly better than those of
IC-738. Ultimate rejection on CW was slightly better on IC-738.

6594. Dual band for the wife as well???

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-21 00:00:00 UTC
From: dd650@cleveland.Freenet.Edu
Message-ID: <3unl4i$h3h@usenet.INS.CWRU.Edu>
Source record: 214907

[Sorry for the lame topic, but I was really hoping to get some feedback on this pretty quick. RS is willing to sell me another 51 for an additional $20 off the already couponed price, but only for Friday and Saturday.]

>Now if I could only get my wife interested, so we could get rid of her cellular...
I know I could buy a new radio each year and have change left over, compared to
<

Interesting that you should mention this. My wife and I are both testing next weekend for our Tech-NoCode. I am hoping we both pass, especially since I already bought and received a FT-51r. Neither of us have a cellular phone, but one (of many) reasons for getting into Ham has been so my wife and I can keep in touch. SOmething I was about to spend just as much as the 51 on for just talking to my wife, which would have cost more in the end, because I new
(knew) I was going to just talk to my wife. :) ANyway, but where I am now is whether I should get the second unit I was planning on. I got the 51 because I specifically wanted the 440 receive for work where the admins transmit. (I definately do not paln to talk back to them, just listen, as I have been doing with my scanner already ...they are on 469.000) Anyway, I also wanted the Dual band for future use, and possibly to be able to talk duplex with my wife when I got here her radio.

THis brings me to my question. I would rather just get here the FT11r. She woudl
like it better because it will be smaller, and easier to use. But I really would like to be able to do the duplex operation. But what I don't want to do is
spend another $450 and find out that the duplex is not all that it I am thinking that it is. Can you offer any insight to this?

I am thinking that the only reason to get her a 51 as well if we will not be doing the duplex, is if the traffic is heavy in the 2m bands. There are mostly 2m repeaters inthe area with only 2 70cm repeaters, one of which is down for the time being.

Thanks for any feedback and comments!!

6595. NiCads in 2m/70cm battery pack???

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-21 00:00:00 UTC
From: dd650@cleveland.Freenet.Edu
Message-ID: <3unjah$gf3@usenet.INS.CWRU.Edu>
Source record: 214908

I was really hoping that I would be able to get the FBA-14 that allows you
to put 4-AA batteries to power an HT. When I got my 51 today, in the manual
it says in more than one place:

"...and do not install rechargeable cells in the FBA-14, as they could explode
if accidentally short-circuted."

"Caution! The FBA-14 must not be used with rechargeable cells. It lacks the
necessary thermal and over-current protection circuits provided in the
FNB series NiCd Packs."

But I was really wanting to use them. One person I talked to privately from
here says that there is not a problem. Has anybody had a problem? I use NiCd for
EVERYTHING and have dozens of sets around here. I have extensive camera equipment
and other stuff as well, including a Pro39 scanner, and handlheld CBs. I have
never had a problem except for a few cells going dead. Does the comapny
just want to discourage me from using them so that I will buy their expensive
batteries? (Oh, I forgot to mention all of the chargers I have here and at work!!)
WOuld it help if I get the heavier duty cells from Radio SHack that have a higher
mAh rating anyway?

Thanks for any feedback and suggestions!!!
Drew

6596. Off name batteries...W&W Associates??

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-21 00:00:00 UTC
From: dd650@cleveland.Freenet.Edu
Message-ID: <3unjkg$gi4@usenet.INS.CWRU.Edu>
Source record: 214909

THis place offers much better prices on all of their batteries. AND they
also offer several models that are rated at a higher mAh. Like for the\
FT-51r, they have the FNB-33 that is rated at 1500 as well as the one
rated at 1200. They also have the FNB-35 that HRO does not even sell (something
about it not being sold in the US) and they also have a model rated at
1500. These batteries are the same size as the Yaesu conterparts.

Does anybody have any experience with any of these? Or the company and
their batteries in general?

Thank for any feedback!!

6598. Re: NiCads in 2m/70cm battery pack???

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-21 00:00:00 UTC
From: Bill Harwood <harwood@sirius.chinalake.navy.mil>
Message-ID: <DC36Jz.LvL@avalon.chinalake.navy.mil>
Source record: 214911

A much better (and cheaper) solution is to use the RAYOVAC rechargeable alkaline batteries (ENVIROCELLS) in the FNB pack. They are cheaper and give you a full 1.5V output for a much longer time. The recharger charges fast and the charge recharge cycle and levels is not a problem. I have given up on my ni-cad packs and use the rechargeable alkiline bstteries exclusively. From the specifications, a broken down old AA recargeable alkaline is still better than a brand new ni-cad. That is higer voltage and more amp-hours.

I need at least four (4) KT88's or 6550 tubes for an old stereo amp.
If you have some of these or know where a reasonable place is to buy
them I would greatly appreciate the information.

Many thanks...

e-mail

6601. Re: Dual band for the wife as well???

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-21 00:00:00 UTC
From: Bill Harwood <harwood@sirius.chinalake.navy.mil>
Message-ID: <DC35qI.LLv@avalon.chinalake.navy.mil>
Source record: 214914

Hi,

It is me again.

After you get the family (and friends) wired up on amateur radio you wonder how you ever got by without it. Those who do not have a license really begin to irritate you. i.e. "oh the restaurant we were all headed to is crowded lets go to another" bring home the milk are simple but relevant. Also finding someone in the mall or that you are picking up is an easy instead of impossible task. The ability to wonder off separately and then get back together in a casual rather than scheduled fasion is a real relationship saver.

Always buy the dual bander and only own one kind of handie talkie in the family. The acessories cost as much as the radio. Batteries, fast chargers, alternate antennas, speaker mikes, ear phones, DC power adapters are a few items. There is also no reason to learn to program and handle two differnt radios. Pretty soon you will join one of the 440 networks and different locals have different mixes and concentrations of 2M and 440 systems.

Full duplex is pretty much and ho hum thing. It is fun to play and show off and may be handy if you are in two cars but in general it is more hassle than it is worth. What is useful is the ability to both scan or listen to a 2M repeater(s) and talk simplex on 440 when in different cars or when making contact for a pickup.

From: dhughes@prairienet.org
Message-ID: <3uocl4$frf@vixen.cso.uiuc.edu>
Source record: 214924

I bought a gizmo at a yard sale today and need help identifying it. I think it is for a radio, but I'm not sure. It could be easy to pin down if you know your Sony parts--it is labeled Sony Model No. EAC-3.
It's a grey box, about the size of a small box of matches, with a knob with five positions (labeled 1 through 5), and a switch to choose Local or Distant. The back of the box has a miniplug and a small prong. The box is attached to a long cable that terminates in a three prong screw-on connector. The local-distant switch seems to indicate an antenna?
Thanks for any help! ---Dan

: 73 Tom

Hmmmmm

My experience has been just the opposite ! I have owned a TL922 since 1988 which uses a pair of 3-500Z's. The kenwood amp is very clean and as far as I can tell is virtually free of parasiticssitics, I have been quite pleased with it. On the other hand I replaced a Eimac 3-500 in it about every 15-18 months. In every case the cause was a grid to cathode short. A well documented and common failure mode for the 3-500. Then almost three years ago I bought a matched pair of foreign (chineese or russina, cant remeber) 3-500ZG's with the graphite plates from RF PArts. The tubes have played flawlessly ever since.

My operating habits are DX chasing and three or four serious contests efforts a year, but no rag chewing. To save myself the embarrasment and Tom the typing time I will point out that the 3-500ZG's graphite plate's are rated at 600 watts dissapation and it is rummored that the grid is beefier and spaced a bit farther from the cathode. So this is a bit like comparing oranges to grapefruit. I will also in my own defense point out that I am very watchful (since the first failure :-) to watch my grid current on the 3-500's and not overdrive them. Overdrive has been well documented to be one of the leading causes of per-mature death to 3-500's. On the other hand my 3-500ZG's put out 800 watts CW with 2kv on the plates and 50 watts of drive, 1250 watts CW with 3kv on the plate and 75 watts of drive. 90% of the time I run in the 2 KV position, particularly when I'm contesting :-). Note however that my operating habits have not changed from I was using the EIMAC tubes.

I saw a thread elsewhere on here about the high cost of 572B's, I note that RF parts is selling them for $104.95 a matched pair or $210 for a matched set of four (For all you old Dentron 10-160L fans, been there done that !). That doesn't seem to bad to me, I do recall however that the foreign 572B's are about 1/2 inch taller. I had a heck of a time getting them into my old FL2100 :-)

Dave

>KE6VMJ

I might be wrong about this but I don't think that you can realiable put two
antenna tuners inline and accurately read the SWR presented on the down
stream tuner. The tuner in the 450 is probably where you should be reading
the SWR. The R7 is tuned for a "sweet spot" on each band. In other words,
you find the area you work the most and then lengthen or shorten until the desired
portion of the band is in tune. Areas above and below this "sweet Spot" will be
a higher SWR.

I own the Timewave DSP-59+. It's amazing and is especially good on the
digital modes. Timewave updates the software in their DSP's and usually
sells upgrades to existing owners for $10. This seems very reasonable to
me. Also, it appears to me they are a bit out front in the market. My experiences
with MFJ have been somewhat lackluster. I'd buy a SWR meter or something
like that from them. When it comes to spending real money, I look at other
manufacturers.

I can do that one better :-)

I have a friend who uses his TS140S on hf digital, and I WIRED his TNC to his rig for him. I didn't find any "wierd connector on the back". Rather, it required only a standard microphone connector and a 1/4" phone plug. Both connectors were on the front of the rig. Maybe your friend's TNC requires special switching signals from the rig, or something. I was using a PK-232.

He loaned me his rig and TNC to use while he was on a trip, under the condition that I do the wiring and make it work. It was a simple job. As for the rig's performance, I had it for 6 weeks, and in general, it worked well. I have only two complants with the rig. First, those rotten slide controls on the front for drive, audio gain, etc are really bad. They are extremely "touchy". It is hard to fine tune them. Second, the receiver has a tendancy to loose sensitivity when there is a strong signal nearby. Normally, this isn't a problem. It is

noticable if you work 40M in the evening in the skirts of one of the strong broadcast stations, but even so, it isn't that bad. I managed to work a QRP station from halfway across the country on the 40M novice band at 10:30PM local time. He was running 2 watts, and I had no trouble hearing him. Never missed a character, in spite of the broadcast stations, so it can't be too bad a problem. I worked several Amtor stations and a few Pactor stations. I had no problems with HF digital on this rig.

Are there better rigs available? Sure.
Would I buy a TS140? That would depend on the price :-)

I have a GE Master II 145-170 Mc 110 watt repeter for trade.
It is in an outside mounting with power supply and duplexer

We would like to find a Motorola or GE 440 repeter.

E-mail me at TKC@netins.net if you have something...

The problem with restrictions such that one is that they open the
door to more restrictions. Before you realize, they could be a
minimal IQ restriction and you, Vincent Simard, may find
yourself excluded from the newsgroup.

No hay peor ignorante que el que no quiere aprender.

>(510) 831-1771.

Oh, No! I have had the experience you mentioned, and it was at the HRO in Anaheim, CA. I understand from other sources that the HRO down in San Diego is more organized to help customers. I have also found one or two employees at the Anaheim store who are much better than others on a bad day. But generally, I do not get treated the way I would like to be.

I have been treated very well by AES in Las Vegas, both over the phone and in person.

Guess this varies, huh.

I live in a townhouse and have tried both a dipole and sloper but for some reason can not achieve a reasonable SWR. I can use them with a tuner but constantly have to adjust. I do have some room on my roof that is hidden. If you have any recommendations as to a reliable limited space antenna or knowledge as to why my pre tuned dipole and sloper have a higher than normal SWR I would greatly appreciate it.

Thanks

>But I was really wanting to use them. One person I talked to privately from
>here says that there is not a problem. Has anybody had a problem?

The problem is that the FBA-14 doesn't have any protective circuits,
so if you short the pack terminals the cells will dump current in a
serious hurry. This can cause a fire or explosion. If you're careful
to never short the pack terminals, you'll be OK. Use of a pack protector
is advised, IE the little card that slides over the terminals when the
battery is off the radio.

Alkaline cells have enough internal impedance to limit the current
in case of a short, but NiCads have a very low internal impedance
and can dump *serious* current if shorted. So NiCad packs have
internal protective circuits to prevent this from happening.

We used to have a old 3047 system collecting dust and tried to get
it running again. Basically, it wasn't worth it. We ended up getting
a 3048 system, which is usable for some types of measurements, but
also has many, many limitations. And this was for use at HP (albeit
a different division than the one that made the 3047,8). I am going
to replace my 3048 with the cross-correlation system made by Femtosecond
Systems. It can go down to -190 dBc./Hz. Femtosecond is a company
started by Fred Wall's son, I think it's in Boulder, CO. Fred Wall
is the dean of phase noise experts at NIST in Boulder.

If you simply must obtain 3047 software, the keeper of that flame is
Bob Temple at the HP Spokane Division. He will probably not be too
happy if you ask him for ancient software, but he is the guy who
wrote it (along with a forgotten software man).

|>Peter
|>KE6VMJ
|>

I had my R7 mounted 6' off the ground and it matched perfectly on 40m.

Do you have all of the radials deployed? They must extend straight out. If
you angle them down at all, the SWR increases.

The AT *is* doing it's job. It can't change the SWR on the R7 but it does
present a 1:1 to the transmitter which is what it is supposed to do.

Other than that, you may have interference from nearby objects.

At what frequency do you get 3:1. I noticed on mine that the 40 m adjusting
rod had to be retracted all of the way to achieve resonance at 7.208.

Did you adjust all of the other sections first? The 40m section is supposed to
be adjusted last as all of the other adjustments will affect it.

Peter
My thoughts are the following:
Do you have enough coils (turns) on your balun?
Is there any metal flashing in the vacinity of the ant?
Maybe a bad 40m trap?
A friend of mine just installed an R-7, and had a short coax run (with no
coil balun). His SWRs were very high. When he added the coil balun and
some ferite beads to the coax, his match dropped to 1.2:1 on all bands.
You may also want to try raising the ant up in 5 or 10 foot increments.
Cushcraft reps have said that if the ant is in the vacinity of any metal,
power or telephone lines, trees, or unclear of structures, there could be
problems. The R-7 appears to be very sensitive to placement. I don't know
how they can advertise it as shown attached to a balcony next to an apt.
building and keep a straight face about it.

6639. Re: Need Bearcat 101 information

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-21 00:00:00 UTC
From: 72717.733@compuserve.com
Message-ID: <3umlmn$4eb@dub-news-svc-2.compuserve.com>
Source record: 214997
Cross-posted to: rec.radio.scanner,rec.radio.amateur.equipment

The Bearcat 101 was my first scanner. Originally, it cost more than my pro2006. I still have it and the manual. I think I captured the essence of what you need to know to get the scanner programmed and working.

Programming Bearcat 101

When the ready switch is pushed down, the 16 channel switches are changed from their normal lock out function to become data
entry switches. When the enter switch is actuated, an automatic cycle begins which erases any previous data in the memory for
that channel and enters the new data then set up by the 16 switches.

Move ready switch down.
Move all 16 switches down.
Manually step channel indicator to channel the number to be programmed.
Set the switches from the formula below in the UP position.
Move the momentary enter switch down and release.
The indicator light will go out for about 1 second.
Repeat the procedure for each channel being programmed.
Turn the ready switch up when finished.
The channel switches now function as channel lockout switches.
For frequencies not listed in the look-up table.

How to calculate switch positions from frequency.

Low-Band: (30-50MHz)
To determine the switch settings for a LOW-BAND frequency:
A. Multiply the frequency by 200 and round off to the nearest whole number.
B. Subtract the number obtained in step A from 10340. Call the result "M."
C. Next we must mark the numbers shown below
which will add up to exactly M. This is easily done by the following step-by-step procedure:
1. Place an "X" in the square corresponding to the largest number which is less than or equal to M.

The graphic in the manual has a 3 row grid. The first row has the 4096, 2048, 1024 ... numbers. The center row is blank. The third row has 1, 2, 3 ...

4096=1 2048=2 1024=3 512=4 256=5 128=6 64=7 32=8 16=9 8=10 4=11 2=12 1=13.

14, 15 & 16 are blank

2. Subtract the number corresponding to this column from M .
3. Repeat steps 1 and 2 until M = 0.
4. To check the program, add all of the numbers marked by an X. The sum should equal M.
D. Place an X in columns 14 & 15.
E. If rescan delay is desired on this channel, place an X in column 16.
F. The Columns with X's denote channel switches to be placed in the UP position. The columns without an X denote channel switches to be placed in the DOWN position.

High-Band: (146-174MHz)
To determine the switch settings for a HIGH-BAND frequency:
A. Multiply the frequency by 200 and round off to the nearest whole number.
3. Subtract the number obtained in step A from 36940. Call the result "M."
Place an X in column 15
If rescan delay is desired on this channel, place an X in column 16.

U & T Bands: (416-512MHz)
To determine the switch settings for U and T BAND frequencies:
A. Multiply the frequency by 80 and round off to the nearest whole number.
Subtract the number obtain(l in step A from 40964. Call the result "M."
Place an X in column 14.

E. If rescan delay is desired on this channel, place an X in column 16.

EXAMPLE: To program a LOW BAND frequency of 40.000MHz:
A. 40 x 200 = 8000
B. 10340-8000 = 2340 = M

Sw Check
M=2340 2048
-2048 2 256
292 32
- 256 5 + 4
36 2340 = M
-32 8
4
- 4 11
0

Switches up would be 2, 5, 8, 11, 14, 15

I think I must also have one of the old ones. The problem is that the dial skips ahead, whether in VFO mode or when going through memories with the dial. Would like to hear official info about upgrade. S/N of my 2400H is 2G201660.

PS: I'm not buying the "dust" story as it has been about the same since I first turned on the radio after buying it new. Not one of those "mission-critical" problems, but could affect brand loyalty.

Kory,

Obviously I think the JPS NIR-12 is the best of the lot, but that may
have something to do with the fact that I designed it :-)
At any rate, if you buy the JPS unit you can send it back for a refund
if you don't like it. By the way, there's a new NIR-12 FAQ on the JPS
web page at:
http://emporium.turnpike.net/J/JPS/jps.html
in case you haven't seen it.

6642. Re: ICOM 751 good rig?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-21 00:00:00 UTC
From: Doug Yarnold <kd4hrt@gate.net>
Message-ID: <3un043$rvc@news.gate.net>
Source record: 215000

I've had the IC751A for several years, and I wouldn't trade it for ANY other HF Rig! Despite the absence of a built in AT (it is, after all, an older ICOM Rig), it is a superior HF Rig. I've adapted an IC AT-150 to the rig. Unless you really want some of the perks on the newer IC rigs, like 6 mtrs, AT, etc, then I suggest the IC 751A. I've been on my share of DX pileups, and with only 100 watts, I'm often able to punch through before the folks with the big amps. My antenna is a 5 element beam, but not one of those huge jobs. Anyway, it's the rig I like, never had any problems, 100% great performance!

I hear people complaining about this all the time. the problem is the sales guys work on commission...the ringing telephone is almost always a sure sale whereas the guy in the store front is probably buying small stuff or nothing at all.

What i'd (and others) would like to see AES O'do do is assign someone to handle the walk ins and put the phone boilerroom out of the storefront. That way no one is led to think there's 6 guys on the counter when all of them will drop a warm body to get to their phone...

Your best bet with dealing with AES Orlando would be to go to the store, but take the cell phone along. when you get ready to buy, you call in, give 'em the order and tell 'em, "Give it to the guy with the lime shirt and yellow pants talking on the cell radiophone over in the corner...thanks..."

I have had an ICOM 751 for about 7 years and the only problem I have
experienced is with the display not coming up at switch-on. This was
due to electrolytic capacitors starting to dry out and from previous
usenet comments seems to be a fairly common problem as the rigs get
older.
There is the odd spurie in the rig but these are quite clean and on
discrete frequecnies.
Overall, I would rate it a very good rig for its vlaue.

Another vendor to check with.

I deal with Alexander Batteries occasionally. They have an office in the San Diego area - I could check at work for the phone number on Monday.

We generally go to them for replacement batteries for some of our older Motorola two ways and OKI Cellular phones. They make cells for a lot of stuff, including ham gear. Most of their prices are 10% to 50% below going to the OEM. I have ordered hundreds of batteries from these folks and haven't had any reason to bad mouth them.

>* GE Technical Communications ** expressed here *
>* vannossc@ipssmail.sch.ge.com ** are my own. *
>***

Ok, after messing around with the radio on my own and then getting the
"official" mod, here's a summary of the various diode mods for the Z1A:

Icom Z1A mods

[B]+[#]+[POWER] = Extended Receive.
VFO *DISPLAYS* 50-299.900 and 300-999.900.
AM Aircraft band enabled.
SET mode now has a new "PLACE" function for setting
the direct entry starting digit.

There is room for four diodes in the Z1A located on the CPU board to the left
of the ribbon cable connector. On a US version, only the bottom two are
installed. D15 is just below and to the right of the four diodes. These
diodes are bigger than the rest of the surface mounted components and are easy
to spot.
The official ICOM mod (which I unofficially saw...) is to remove D15 for
extended TX and to use the above keyboard mod for extended receive. According
to the sheet, the 800-900 band is NOT available in US versions.

```
+-+ +-+
| | | | <---- Installing diodes in either of these seems to do
+-+ +-+ nothing.
```

```
+-+ +-+
| | | | <---- IN: US Version 144-148 TX 440-450 TX
+-+ +-+ OUT: Extended 136-174 TX 380-470 TX (Lose auto-repeater
^ and tone encode)
|
+------------ IN: US 144-148 TX 440-450 TX
OUT: European 144-148 TX 430-440 TX
```

```
+-+
"D15"--> | | <---- IN: US Version Stock
+-+ OUT: Extended TX 136-174 380-470 (keeps auto-repeater
and tone encode)
```

A word of warning about messing with the four diode pads: If you detach either one of the installed diodes, the CPU will reset and you'll lose ALL of your memories. (found that out the hard way...) D15 doesn't seem to affect the memories at all.

Since the 800MHz band is not available in US versions, my guess is that there's a keyboard mod to unlock it instead of a diode. The diodes only seem to control the country versions. If anyone has any more keyboard mods, please post them.

Bruce KD6ALI

>Dave
>

I have a Yaesu FT-2400 (the previous version) and absolutely love it. It has the same receiver specs as the Realistic HTX-202 and picks up as little interference as the HTX-202. Great radio for heavy RF areas. My only complaints with the FT-2400 are:

1) No direct frequency entry.
2) No DTMF dialing memories (have to do the autopatch manually)

These are relatively minor nuisances since I don't use the autopatch very often and have my most used simplex frequencies stored in memories. It is a very well-built radio, though, and I wouldn't hesitate buying a second.

I talked with a couple of local hams who are visually impaired and here are the radios that they use:

AC6IS, has an older Atlas that uses an outboard speech synthesizer that was made by someone in Washington. This cost him about $300 a couple of years back.

KD6MAZ has a Kenwood TS-440AT that has a built in speech synthesizer along with an antenna tuner. I was over helping him with this radio when he first got it and the voice sounded very good.

Whish I could be of more help, but these are the only ones that I'm familiar with.

: reading of this problem, yet I cannot locate ANYONE personally who has
: experienced it. I, myself, regularly use 12VDC with my HTX-202 and
: rubber ducks with no problems whatsoever.

I get it with both my htx-202's. It comes from rf geting into the radio.
It happens mostly on 146.925- (actual 146.325). If I use a different antenna,
or a different frequency, the problem goes away.

The problem has never occured for me with an off-radio antenna.

73,
Geoff.

: rated at 1200. They also have the FNB-35 that HRO does not even sell (something
: about it not being sold in the US) and they also have a model rated at
: 1500. These batteries are the same size as the Yaesu conterparts.

: Does anybody have any experience with any of these? Or the company and
: their batteries in general?

I have had batteries both from periphex and W&W. One of the W&W batteries
failed after a few months and was replaced by them. The replacment has
worked fine for almost two years.

I also like their mastercharger I charger. It works well for me.

Periphex is on my you know what list. I puchased an ICOM ht, I think it
is a 2gxat. This is the 2 meter high power unit that uses the same batteries
as the w21at.

I ordered two 12v batteries from them. When they arrived, I tried one
out and it did not fit. Although I did not force it, it cracked my
radio slightly.

I went back to the store that I bought the radio from and looked at a
w21at and its batteries. They were differently shaped than the
Periphex ones.

However, the periphex ones fit the w21at and I liked it so much that I
decided to buy it.

When I explained the situation to the support people at periphex, the
agreed to swap the black ones I had for w21at gray ones. I sent the
batteries back and got the grey ones.

What bothered me is that the charged (without asking me first) my credit
card for the return postage. Since it was their batteries that damaged
my radio, they could of at least paid the postage for the batteries.

They also seemed indiferent to the fact that my radio was damaged by
their batteries.

IMHO, charging me the return postage was adding insult to injury.

73,

Geoff.

I have a '92 Ford Pickup, and have no problems with 2m, but a friend
did have problems with the electric fuel pump noise while trying to
use a HF rig mobile. He was able to get Ford to fix it, but it wasn't
free! In fact, it cost him around $200.00 to have it fixed.

I am hoping that there are some amateurs out there that have some experience with the Ten Tec Scout 555 Radio. I am a new ham, and a college student, so I do not have a great deal of money to spend on an HF rig. The advertisements for the Scout seem impressive, but any operating experience with the Scout of opinions of Ten Tec in general would be appreciated.

Tnx in advance.
Jeff

have the MFJ-784 right in front of me and I have played with the NIR12
at the club. The idea that the MFJ is adjustable is very attractive but
in fact the factory settings are pretty right on the NIR. They both need
very (very) careful attention to the input level. Too much and they both distort

I bought mine for the noise blanker as I am not impressed with the
built in blanker on the TS850AT. I'ts not a patch on the TS930SAT.
The noise filtering is good but not perfect in the MFJ and my impression
with the NIR was that that aspect was maybe a little better, but not
much.

For the money the MFJ is better value, probably.

The MFJ annoys me insofaras the bandwidth control knob works the opposite
way to the way I expect it to! Somehow I think the wide selection should
be at the fully clockwise position. It isn't. That's narrow. Just me,
I guess.

Cheers. Murray Kelly. vk4aok.

I think it all depends on the individual you happen to be dealing with. But you're right, some of the "staff" at AES/Orlando can be a bit hard to deal with. Amazing that companies can stay in business without treating their customers right...guess it just proves how desperate we all are for radios hi.

Guy enters a store (not a homeless person). Three guys at the counter-one engaged in social chitchat with someone, another working on the phone with a customer a third entering data into a PC. Guy waits 4-5 minutes. Store clerks don`t even recognize his presence. Guy approaches clerk working on computer. "How long will it be before someone can wait on me?" Clerk says: "I`m gonna be busy for 30 minutes".

This is the kind of treatment you can expect at Amateur Electronic Supply in Orlando.

I have received email from others who have been treated poorly by these jerks. IMO, they are a bunch of A**holes.
For those of you who are unhappy with these guys, there's always Ham Radio Outlet, 390 Diablo Rd., Ste 210, Danville,CA 94526 (510) 831-1771.

Maybe at first the rechargeable alkalines look better, but have they
fixed the problems where they lose capacity everytime you use them and
re-charge them? Not for me. I have nicads that I've been using for
over 10 years on a regular basis and they haven't failed me yet. I am
a stong believer in trickle-charging 'em though. Less heat, less
dielectric boiling away, less wear and tear, longer lasting. Nope,
Nicads are still the best value for the long haul IMHO. -Mike

I've been using a W&W 'IC8S' 9.6V @ 1200 mA battery for several
years with an IC-2GAT. Works great. The finish is ok although the
fit is a bit *tighter* than the stock Icom batteries.

Check out the power resistors by Caddock- they make 'em in TO220 tab mount packages. 50 ohms is a standard value- if you keep the leads short, they will work well into the 2 meter (144 MHz) range.

HAM GEAR FOR SALE !!!!!!!!!!!!!!!!!!!!!
******************************************************

To raise money for a new radio,
I have for sale the following gear:

1) MOTOROLA Radius P200 6 Channel UHF 4 Watt HT.
Excellent shape. 440-470 PL/DPL. Includes normal
and Hi-capacity batteries, standard charger, earphone
adapter. $300.00

2) MFJ 1270 TNC. Basic VHF TNC. Includes AC adaptor
$50.00

3) KENWOOD TH21AT 2 Meter HT.
Includes standard and Hi-capacity batteries & Chargers.
Excellent shape. $125.00

4) ZENITH MINISPORT MS-DOS Laptop. 1MB Ram, 2" floppy disk.
backlit supertwist screen. Great for portable packet. Includes
battery, AC adapter/charger, diskette. $125.00

5) ICOM IC-735 160-10 Meter HF rig. 100 Watt output.
General coverage RX. Includes 500 Hz CW filter,
built-in iambic keyer unit, hand mic. Perfect shape.
$675.00

6) GENERAL ELECTRIC/PARKINSON REPEATER
GE Custom MVP repeater by Parkinson Radio. UHF band.
25 Watt output, internal controller unit with PL.
Completely self contained unit with Phelps Dodge
duplexer. Includes matching supply/speaker, mic.
Currently on 442.25/447.25. I used this for ski trips.

I've had good results with RL Electronics in Indy. Check their
prices. They seem to be slightly customer friendly.

Ken,

Thanks for the reply. I appreciate the information you passed along. So
far, I think the TS-440 is in the lead. I have one in the shack, and I
think one would do well for our new member.

Thanks again, and 73!

Dan Ostroy (dao@mrspock.mt.att.com) wrote:
: Has anyone else observed the following problem when using the MFJ TNC
: in KISS mode?

I have noticed the same thing on my MFJ 1270b which is about two years old, but I do not think it is a problem.

: Actually the restarts don't usually cause a problem, since the unit
: comes back up in about 2 seconds, reloading the parameters it had
: stored in battery-backed RAM. However, a couple of times I noticed
: that if NOS was sending some data to the tnc at the same time it was
: in the restart cycle, strange things might happen - like a total
: lockup requiring recovery with a power off/on sequence and a
: loss of b-b RAM data. This could be a problem at a remote site !!

You are right they do not cause a problem. There is also not much that it has to load out of RAM. All it loads is the fact that kiss is on. KISS is a very small program compared to the normal command interpreter that the tnc loads. All of the work of putting out data and handling incoming data is mostly handled by your computer. KISS meens (Keep It Simple Stupid). When your TNC is in KISS mode it is basicly a stupid box waiting for data to go through.

This also would not cause a problem for NOS because it checks flow control before sending data.

Here is another question for you. Does your TNC generate interferience on 2m close 146.940? Mine make so much noise that it almost blocks out our local repeater on all the radios in my shack?

ESTATE SALE

I am posting this on behalf of the family of Bob Cameron K2IWK (SK). Bob worked for NBC in NYC for many years.

The following items are for sale:

Heathkit Oscilloscope Model OM-1

Precision Signal Generator Model E-200-C
(10kHz - 120kHz)

Ameco Model VFO621 50,144 & 220 MHz VFO

Ameco SWR bridge

Clegg 22er 2m Xcvr

Swan 250C 6m Xcvr (AM/SSB/CW)
TV2B 2m downverter
117XC Power supply for above

RCA Voltohmyst VTVM

RCA Power line monitor tested - works

Polycom Polycom 6 6m rig with mic

Turner Mod. 454X mic with stereo plug

CDR Rotor control (no rotor) uses 4 wire cable

Numechron Tymeter Digital 24 hour clock with
10 minute ID timer

Globe Tenna Meter Rcvr matchbox

Electro-Voice Mod. 619 Hi-Z Dynamic mic

Vibroplex Semi-auto bug (speed key)

Miscellaneous meters, cables and books (ca. 1960s)

According to the family, all the above were in working condition when Bob passed away. However, all items are being sold as is.

Please contact Bobs daughter, Helen, at 203-853-3580 (Norwalk, CT) if you are interested in acquiring any of these items.

I am posting this as a courtesy to Bobs family. Please do not post replies or queries to me. They will be ignored.

Not to jump on the bandwagon carping about our ham radio
suppliers, but I and many others, have come away with a
very uncomfortable feeling after visiting Ham Radio Outlet
in Portland (Tigard), Oregon. Several instances have occurred
but the one I remember was wanting to look at the new Icom handheld.
They did not have one on display, but had a dozen in boxes on the
shelf, and I was simply told, 'they are good radios, but we don't
want to take one out of the box'. So, I guess I am supposed to
lay down my $350 for something I have not been able to evaluate,
or even hold in my hand. The same problem existed with books, where
they were all sealed in cellophane. I suggested that they should have
an opened display so that potential buyers can evaluate the book.
I really felt being abused as a customer wanting to spend my money,
but smart enough to demand to know what it was I was buying.

This may be a function of low pay, long hours, though most people
would like to work at something they enjoy, and customers should
demand more, or take their money elsewhere.

dan

6717. FT-11R Overheating at 5W

I paid $579 for mine back in March, and then got $50 back from
Kenwood. As a sales puch for Oklahoma Comm, all Amateur gear
I have bought has been from them. Always has had the best price
(so far) and they pay shipping above $50. They are very quick.
As an example...I call on Monday morning, and it is at my door
on Wednesday (I am in Colorado). We have an HRO in Denver, which
is 60 miles from me, I never buy anything there because I can
elude being taxed through the mail. On a one grand rig, that
can add up!

My pet peeve about many counter workers regardless of store is their
over eagerness to answer the phone while waiting on a live customer.
The ONLY way to handle these calls is to take the caller's number and
call them back. Last week while at a parts counter I was interrupted
twice by incoming calls while the clerk answered them both. I was
ready to walk out if he took a third call.

Phone etiquette is a major concern in the office place as well as at
retail establishments. Material can be obtained from the local Bell
operating company that educates personnel how to handle customers over
the phone. DOWN WITH IGNORANCE!

Speaking of jerks, let me tell you about my experience with
"Radio Works," located in Virginia. I called their (non-toll-free)
order line and left an order on their answering machine, with credit
card #. My card had a zero balance and was - still is - "good." A week
or so went by and no order. This was a mobile 2-m antenna. I called
again...asked them to check the order and call me back. Called AGAIN and
asked to check. Finally, on the THIRD try (all of these toll calls), the
woman who answered rudely told me, "Your credit card didn't clear." Keep
in mind that they had my phone number and could have called...apparently it
was a data entry error! They didn't say, "let us straighten this out," or
"we're sorry you were inconvenienced," or anything...treated me like I
was the "bad guy." I have news for them: as the customer, I'm PROFIT, and
they are OVERHEAD. I wonder how long it'll take them to figure that out?!
(BTW, a letter to the company's owner got zilch response.

Hi everyone,

I really need some help on this one: my son's summer project is to assamble a simple radio (I guess it can be very simple one), but I don't know where to find the blue print for this radio. Can anyone give me some clues to start this project please?

Ning

This is unbelievable! The radio needs to have the belt clip installed because it acts as a heat sink? And I am acused of bashing RS too much and that I am not objective? Give me a break!

BROONEY wrote:

>Can I use a power resistor 50 ohm, 10 watts [as a QRP dummy load]?

Yes, that is perfect. Just be sure it's a composition resistor, and not wire- wound. The wire-wound resistor is inductive, which will make it a reactive load.

6727. Re: Using MFJ 259 as frequency counter

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-24 00:00:00 UTC
From: morawski@starbase.mitre.org
Message-ID: <MORAWSKI.95Jul24174041@starbase.mitre.org>
Source record: 214759

Whatever you do, DON'T TRANSMIT INTO THE THING!

I recommend transmitting into a dummy load and putting a rubber duck antenna onto the 259 and using it as a "sniffer". OR, transmit into the dummy load and use a wire loosely coupled to it as a sniffer.

BTW, the MFJ 259 is a big disappointment as a frequency counter--it's too insensitive. It requires something like 500mv to detect a signal. By comparison, the Radio Shack counter requires something like 5mv!

From: harrisok@vax.sonoma.edu
Message-ID: <1995Jul24.171145.1@vax.sonoma.edu>
Source record: 214760

I noticed something interesting regarding my Yaesu FT-530 today.

I recently put up a large base antenna for 2 meters and just for kicks hooked up my 530 to it. I noticed the increased intermod, as was expected, but I also noticed something else.

I tuned the same 2m frequency on both sides, the VHF and the UHF. There was markedly more interference on the UHF side when tuned to the 2 meter frequency than the VHF.

I just thought I'd pass this along, FWIW.

73,
Ken

I've ordered stuff from AES via the phone, but I've never been to the AES stores and all I have to say is that they are fine over the phone.

I've have been to the HRO in Anaheim several times and found their sales people unfriendly. The store can be completely empty and you have to practically grab a salesperson in order to get some service.

I've been to the HRO in Van Nuys once and have found them friendly and helpful. Although I haven't been there enough times to know that it may be fluke.

>clean and as far as I can tell is virtually free of parasiticssitics, I
have
>been quite pleased with it.

Parasitics have nothing to do with HF tube failures. Parasitics have *never* been found to cause tube failures except in the case of very high power UHF TV transmitters where the tube can go into a cavity type internal upper UHF or microwave oscillation.

>On the other hand I replaced a Eimac 3-500 in it about every 15-18
>months. In every case the cause was a grid to cathode short. A
>well documented and common failure mode for the 3-500.

If I am not mistaken, the Kenwood is an electrical clone of the SB-220 except it uses a series filament connection. That is a definate no-no due to the design of the tubes. Imagine a series circuit with two tubes, and one has a slightly smaller filament wire diameter. The thinner filament will have higher resistance, and heat faster.

At turn on the thinner (and weaker) filament has higher resistance. Since the current is equal in both tubes, the thinner and weaker filament dissipates more power and heats quicker. As it heats it's resistance rises

rapidly, and it dissipates more power. The heavier filament that can best take the thermal shock dissipates a disproportionately smaller amount of the power at turn on, and the weaker thinner structure that can least handle the thermal shock receives the brunt of the turn on power. No wonder the 922 eats tubes!

In order of failure a company I consult for has recorded Eimac 3-500Z failures. The records show they failed for the following reasons. The pecentage of failure in warranty was 7 percent:

1.) almost 70% of the failed tubes were from defective anode welds (corrected by a material change in 1994).
2.) 26% failed from gas related arcing (*the big bang*) from anode to other elements.

3.) 2% failed from filament to grid shorts.

>Then almost three years ago I bought a matched pair of foreign
>(chineese or russina, cant remeber) 3-500ZG's with the graphite plates
>from RF PArts.

I wasn't aware of China or Russia building 3-500 graphite tubes that long ago, but Amprex did in France. Could those be Amprex tubes from the Richardson plant in France? Or did I miss a source?

>The tubes have played flawlessly ever since.
>To save myself the embarrasment and Tom the typing time I will point
>out that the 3-500ZG's graphite plate's are rated at 600 watts
>dissapation and it is rummored that the grid is beefier and spaced a bit
>farther from the cathode.

The materials may be different, but I doubt that the element spacing has changed. Moving the grid away from the catode would raise the driving impedance and lower the gain drastically in a GG amplifier. Perhaps the filament is held to closer tolerances and lives better in the series circuit
(I think the Kenwood is a series circuit).

Did the Eimac's fail by simply drawing high idle current when the T/R relay was deactivated? If so that was a filament to grid short. If they popped or banged that was gas or a mis-aligned anode from a weld.

>So this is a bit like comparing oranges to grapefruit. I will also in my
>own defense point out that I am very watchful (since the first failure
:-)
>to watch my grid current on the 3-500's and not overdrive them.
>Overdrive has been well documented to be one of the leading causes of
>per-mature death to 3-500's.

In typical GG circuits at the bias and voltage range used by the Kenwood rated grid dissipation is reached at around 300 mA of grid current per tube! If you keep each grid below 150-200 mA the tube should be plenty safe.

Dave, I am not trying to defend Eimac or condem the Chinese, but there is a lot of hearsay information that circulates. The information I have supplied is from the warranty records of a company that uses more 3-500Z's and sells more amplifiers than any other manufacturer...so the data base is several thousand tubes large.

I may be in error in understanding that the Kenwood uses a series filament string, or by missing the fact that some less well know Chinese or Russian company made graphite anode 3-500 type three years ago. I have also received sample tubes from China that were re-labeled US surplus tubes!

Selecting a different tube helped you, but I believe the long term cure for
the 922 is a different filament transformer...there is no doubt that series
filaments stink. I still stand by my comments that the general ham market should avoid 3-500 Chinese tubes until they learn how to make good glass and buy some dial calipers to measure production dimensions! We couldn't fit plate caps on some tubes! When we sent them back they GLUED different anode connectors on the tubes...

duhhhhhhh.

I think it is a problem with a lot of the new (smaller) HTs. My wife and her father both have problems when they get long-winded on their IC-2SATs. The units get too warm to hold just using the internal battery packs. My IC-32AT never gets warm, even with the BP7 battery.

6738. re: 49MHz to 220MHz transverter???

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-24 00:00:00 UTC
From: Michael.Black@juxta.mba.org
Message-ID: <c41_9507241730@mba.mba.org>
Source record: 214770

Rob Bellville <bellvill@ultranet.com> asked if anyone remembered a 220 MHz transverter kit that used a Radio Shack 49MHz walkie talkie as the transceiver, and was hoping to find someone who had one for sale, so he could get on 220 cheaply.

I don't remember ever seeing a kit. There was an article in QST for January 1990 that described such a scheme.

"The Elevator: A Simple 220MHz FM Transverter", by Mike Agsten. It was on page 32.

I'm sure the ARRL will sell you a copy, or a photocopy of the specific article if the issue is out of stock.

The idea is quite good. Comparing the schematic of one of those Radio Shack double conversion walkie talkies to a Radio Shack crystal controlled VHF/UHF monitor from a f few years ago, the receiver differs in the front end only. I haven't examined the boards closely to see whether the 455KHz if filters are different.

So while the receivers in those walkie talkies aren't the world's greatest, neither are they junk. I think they do have great potential as a start for various projects. I picked up a pair last fall for ten dollars each, intending to convert them to some ham purpose.

The transverter described in the article is not particularly special. It is meant for the much lower power output from the walkie talkie transmitter, and includes a circuit for detecting that low power to do the switching from receiver to transmit in the transverter.

Any transverter would work with the walkie talkie, as long as it could accept such a low power input, and the switching could be dealt with.

One interesting thing is that the article mentions trying the idea on 2M, then discarding it since the third harmonic of the 49MHz transmitter is too close to the 2M band to allow for proper spurious rejection. ONe way to get around that is to change the transmit crystal, and rather than get it to 2M using a transverter, use a tripler. This is a traditional method of getting up there. Then use a usual converter for receive. That's one way of getting cheap 2M rigs going for non-synthesized use.

I have no idea who has one of those kits for sale. The author
did sell a kit to complement the article. It was a construction
article first, though. You could dig up the article and build
the transverter from the article, or try to get ahold of the
author and see if he has any kits left.

>the audio circuit by using these lower impedance phones?

Someone would have to check the schematics of each item you're using in order to advise you accurately on this. However, I just bought a N.O.S. pair of mono Superex headphones that can be converted from 600 to 8 ohms. They were very inexpensive, less than $10. If you can find a set like this, it might provide the best solution of all (Sorry, I bought the last pair at this particular dealer).

brooney@aol.com (BROONEY) wrote:
>I have an HW-8. Can I use a 50-ohm resistor for a dummy load? What power
>rating is needed for short transmissions?

You can parallel carbon composition resistors to build a suitable power capacity for this rig. For instance, by paralleling (2) 100 ohm, 2 watt resistors, you have a 4 watt, 50 ohm load. Paralleling (4) 220 ohm, 2 watt resistors will yield 55 ohms (close enough) at 8 watts. Just be sure A) the resistors really are non-inductive, and B) you keep the leads as short as possible. BTW, do not use carbon or metal film resistors for this purpose. The resistors must be true carbon composition, non-inductive.

>Can I use a power resistor 50 ohm, 10 watts?

Not if it's wirewound (which it probably is). The inductance of the resistive element will introduce undesired reactance at HF frequencies.

>Can an AC voltmeter be used to measure RF volts?

Only if its specifications cover the frequency range you're operating on. Most inexpensive AC voltmeters are useless at RF, so unless you have a 'scope, your best bet for measuring output is an accurate wattmeter.

Let me know if you find the 800 mhz mod for FT-530.

The digits of my serial #4F332017.

Mine has the green wire, but I have not cut it as of yet. It sort of
came lose when I took the solder off of pad 13. I got the extended tx
& recv. I also get 800 on the display, but have not been able to receive
the 925 ham local reperator.

well, if you could be content with potential dc-daylight emission (that is
you don't have a way to check for spectral purity when done) the Ramsey
would probablu fill the bill.

what about some stuff from the older QSTs and such (say around early 70s?)
probably have to do some rework to use modern parts (talk about a learning
experience)...good chance they might be useable when finished.

>the audio circuit by using these lower impedance phones?
>
>Bill/KG8HR

It probably won't cause any *damage*; the audio circuit is trying to drive quite a bit more current into those low-impedance cans than it was originally designed for, but at the levels involved it won't cause any smoke to leak out.
HOWEVER, if you want to really hear the receiver work as intended, find some hi-Z headphones (or build/beg/buy an impedance transformer). The audio sensitivity of the receiver is directly related to the impedance of the 'phones; overloading the audio circuits by using 8-ohm 'phones will give mushy, distorted, low-sensitivity audio. You may not notice it without a basis for comparison; but if you plug in some hi-Z ones it will be NIGHT AND DAY!

Good Luck

According to MFJ, you can disable this reset by sending PARAM 253 to the
tnc, I use it in my 12070c and it cured the problem. Not all NOS's can send
PARAM 253 to the tnc, you may have to edit and recompile the code, don't
remember where in the code.

The big problem here is one of cash - yes, we could replace the logic, and we'd very much like to, but new logic isn't cheap. If we take the cheaper route, and start to develop our own, that takes time. We have a working box, and we'd like to get it on the air, then start an upgrade program.

Help please,

I have a 900MHz power amp module, purchased new at a flemarket.
It looks like it bolts onto the back of a rig, as it has large heatsink
fins on one side.

It has the following printed on the PC board,

MULITPOINT NETWORKS
900MHz POWER AMPLIFIER
PC100033 Rev. 1/C

It has 2 RF connections, and an 8 pin header (next to a trim pot.)
Is anyone familiar with this module, especially the pinout of the
header?

I would be very grateful for any info on the unit.
Thanks for your time,

Kory,

My MFJ1278B works very good in CW, RTTY, Pactor, and FAX modes. I have no complaints with the Data Controller at all.

The Multicom Software I bought is very bad. It is a DOS program that is unstable, crudely copy-protected and not supported by updates. IMHO, SSTV and image software should be purchased elsewhere for the MFJ Data Controller.

Use two 50 ohm, 1/2 watt resistors connected in parallel.

I don't see any reason why an AC voltmeter would not measure

RF energy but the meter must be able to work with its intended

frequency range.

Metal oxide resistors work great through 2 meters.See page 36 of
January 1995 QST for a 25 watt attenuator design, complete with
a photograph of the tested unit.

It was tested with 0.6A at 30 volts of DC (18 watts) for a few
hours. It had better than 30 dB of return loss below 50 MHz.
In other words, the SWR is too low for most amateurs to measure :-).

73-
Bob Martin N6MZV <<<<

Bob, Don't you mean " *Get your* check out? Those resistors are great but the are expensive. I'd vote for two 100 ohm two watt comp resistors in parallel or a regular dummy load. The Caddok's are great but rare and costly outside of a manufacturing quantity. ;-) 73 Tom

6767. ICOM 751A Power Output Problem

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-24 00:00:00 UTC
From: lwwald@lmsmgr.lerc.nasa.gov
Message-ID: <24JUL199510524962@lmsmgr.lerc.nasa.gov>
Source record: 214839

My ICOM 751A has an interesting problem...when I first turn it on
the maximum power output on any of the bands ranges from 35-50 watts.

After the radio warms up it will put out a solid 100-120 watts.

Has anyone seen this kind of behaviour with their rig?

73,

Larry, KE8GW

I've got a TimeWave 59+, and love it- the updated code (from earlier this year)
not only improves things, it tells me the folks that produce it are interested
in improving the product and listening to customers.

I took it out on Field Day this year, and it was a BIG help on 40 meters, and
on RTTY. The only problem I've got is remembering to turn off the tone filter
when I go to RTTY. I can now get solid copy on stations that can't hear me!

Well, if you want to wind up with a 2 meter rig, you're looking at
Ramsey or Hamtronics. You really need access to a spectrum analyzer
to tune up the Ramsey properly. If you just follow their instructions,
you're likely to be radiating a spectrum that looks like a comb.
(There are other annoyances too, but there are simple fixes for
most of them.) This is a fairly simple diode programmed synthesized
2 meter rig. It's a good project if you realize it won't compare
with factory built rigs as is, and if you're willing to make intelligent
modifications to the circuit to improve its performance.

Or, you buy the Hamtronics receiver and transmitter kits.
You'll have to come up with your own switching and packaging.
You'll have a crystal controlled rig when you're done, but
at least it's likely to be clean when tuned up with simple
equipment.

In either case, you're going to spend more than you would for
a used factory built amateur rig, or for converting a commercial
two-way radio to 2 meters. (The latter is an excellent value,
not only will performance be superior, but these radios can be
picked up cheap at hamfests.)

If this is to be the prospective ham's first project, may I suggest
something less ambitious? A simple monitor receiver perhaps?
Ramsey has those, and so do a few other places. The Motorola MC13135
evaluation kit is a good little receiver too. By starting with
a simple project, it's more likely to be completed, and it's more
likely to work. Nothing is more discouraging to a beginner than
building a fairly complex project only to find it doesn't work
when you turn it on.

Troubleshooting can be fun once you gain a little experience,
but it's daunting at first, especially if the radio has *never*
worked. When repairing a broken radio, you at least know it *used*
to work, and that's a big advantage.

>I have an HW-8. Can I use a 50-ohm resistor for a dummy load? What power
>rating is needed for short transmissions? Can I use a power resistor 50
>ohm, 10 watts?

You need a non-inductive resistor for your load. The most likely way
to get that is to parallel a bunch of carbon composition resistors,
IE 10 470 ohm 2 watt resistors in parallel make a 47 ohm (close enough)
20 watt dummy load. Keep lead lengths as near zero as possible. A good
way to do that is to solder the resistors between two pieces of copperclad
circuit board, drilled with a hole pattern to accept the resistors in
each board, sandwich them in, and solder. Drilling the hole pattern
in a circle is a good plan. Looks like this:

```
_________
||||||||
RRRRRRRR wires go to each piece of copper clad from an RF connector.
||||||||
---------
```

>Can an AC voltmeter be used to measure RF volts?

Most AC voltmeters are only good up through audio frequencies. There
are RF voltmeters, but they're rare and expensive. What you need is
an *RF probe* that you use with an ordinary DC voltmeter. There's
probably still an example in the Handbook of how to build one of these.

The lot number of your radio is 33. Unfortunately, 32 was the last lot to include the electronics capable of receiving 800 mhz. The green wire mod is all that is needed to open up the 800 reception on earlier units.

>Ham Radio Outlet, 390 Diablo Rd., Ste 210, Danville,CA 94526
>(510) 831-1771.

I must say I have never dealt with AES, but I have been treated fairly at HRO in Portland OR. However, generally anyone in the service industry should treat all customers equally. I like to go to shops like you describe dirty and sweatty from mowing the lawn. That way I can look without be bothered and bothered by the commissioned sales staff (This applies to things other than just Ham equipment).

Than when I want to purchase something (usually expensive) I get the new kids on the block cause the other sales man figured that guy couldn't have $10 to his name. Anyhow here I am paying cash for a expensive radio letting the new salesman reap the bene's and watching the other idiots just stand there looking stupid. By the way - new sales people are always more curtious and helpful and so forth and so on.

I'd say vote for your store with your dollars, if you don't get the service you want, go somewhere else, when sales drop the store will get the picture

especially if you tell management about it!!!!

6777. MLA-2500 Conversion to 3CX800A7?

>receive UHF radios? Now I don't know the specifics of exactly WHAT is

Some people object to how the government caved in to cellphone
and cable industry lobbyists. If you don't want us to listen then
don't broadcast it in the clear...

>blocked out (is it just the cell-phone freqs or does it extend past that
>somewhat?) but if all you have to do is sit there and listen to
>other folks' phone conversations, well, you need to get out a little more.
>So I don't see the big deal. Or am I missing something (very possible)?
>Just wondering.

Everybody has their own reasons for listening. I can think of a few:
- Because it's there.
- Because assult scanners were banned.
- The State sez it's bad.
- Just because.

Of course most of it is pretty dull, but then again you could say that
for much of what you hear on a scanner. What people do with their own
time is their own business.

Yaesu completely changed out the chips inside the radio. I opened my friend's up (his didn't receive 800, although it could be entered) and compared it to mine (which does receive 800) and they had totally different chips inside the radios. Guess they wanted to make it permanent.

From: lennys999@aol.com
Message-ID: <3v421m$5kf@newsbf02.news.aol.com>
Source record: 214709

I have an ICOM IC-24 AT and it can operate in full duplex mode. My problem is, I would like to use it with the 'one way' cross band repeater function on my Kenwood 733A (where only the 440 in side get's retransmitted out on 2M, the 2M input does not get retransmitted, and you essentially have a mobile extender). Using full duplex, you can transmit on a 70 cm freq and when you RX, you can listen to the 2M side, problem is 2M rx is active when you TX on 70cm. This would work if you could 'mute' the receiver while transmitting. Has anyone tried this?

Tnx Lenny, WO9X.

My club would like to put up a 220 rptr. I am interested
to know our options. We could buy one, and be out a lot
of money. Our 440 rptr is an old Motrac, cheap and reliable.
I have never heard of any business band radios/rptrs that can be
converted to 220 but I am thinking if they do exist, this
could be the cheapest route.

I would like to hear what other clubs have done to get on
220 cheaply (if it is possible!). Please share what you
have done.

Thanks for your time!

Thanks, Chris. When I read that "receiver performance may decline slightly" I associated this with the received strength, which is lower, of course. Obviously receiver performance would also include rejection of intermod. ;-)

Don't worry about this Duffy character Dan, he had a bad experience working
for Radio Shack hence he carries the baggage around with him on the net.
Too bad he cannot be more open minded...some day he might actually enjoy
the use of one of their products !
I personally like the fact that R/S is attempting to get in on the
Amateur Radio action...sort of a return to their roots. The items my not
be of highest quality but they sure are more affordable. Good for
competition too ! May help to keep the prices of the 'other guys'
inline.

6805. ? on Motorola Mute Monitor to Centracom

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-25 00:00:00 UTC
From: Curtis Wheeler <cwheeler@ccnet.com>
Message-ID: <3v31el$ie3@gaudi.lahabra.chevron.com>
Source record: 214776
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I was trying to find another, more appropriate group for this but I don't seem to see one. This is directed to those of you that work with commercial equipment - namely Motorola base stations and related.

In order to use Stat-Alert signalling we recently made some changes to a radio system...

-- Changed a MSF5000 from DC to tone control (it's an older analog only unit) and added a wildcard.

-- Installed a Mute Monitor (MM-II).

-- Upgraded our Centracom II to a II Plus and added a Display Channel Control Module (DCCM) for the radio that will use Stat-Alert.

All of the new equipment seems to be working fine but something wierd is happening and the users have asked what it is, and why it's there. Here is what's happening... About every three to four minutes the "channel free tone" drops and and a lower frequecny tone (I haven't tried to measure it) appears on the wireline for about a half second.

This short tone ends up coming out of the operator console speaker. It seems to be coming out of the MM-II. Since the channel free tone goes away when it happens, the Centracom send it to the speaker. Like I said, it's very brief.

Is there anybody out who works with this type of equipment and knows what this might be? Are there any non-amateur, radio newsgroups that I might send this question to? There used to be a wireless group under comp."something" but I can't find it now. BTW the project coordinator has asked Motorola about this but hasn't got a definitive answer - just in case someone is considering the obvious, "Why don't you call Motorola" response to this.

Please post or mailto:cgwh@chevron.com or mailto:cwheeler@ccnet.com

Thanks

I wonder if anyone could help a friend of mine with the following problem.

He has in his posession a morse decoder/encoder piece of software and interface
for a spectrum computer. The problem is that the interface has leads comming
from it which are supposed to got to the ear and mike socket of the computer.

The problem is that he is using a spectrum +2 which I believe has a built in
tape deck and hence no sockets.

Any one any sensible solutions - apart from him re-learning his cw?

Cheers,

Keith.

: It it total junk? Obviously it wouldn't work with anything
: big, but I was thinking of maybe a small 2-meter beam...

I have had an 11 element two meter beam with a five foot mast on mine for three years now. It works, I can say that much, but when the winds come it sways around a good bit. Afterwords I have to do their little trick to reallign it. It is never very accurate. If you don't need pin-point accuracy and you have a small antenna, it works. Otherwise I suggest going with something else.

: Thanks,

I use one of these, heavily modified, to turn a 450 MHz remote pickup antenna which is a real hog. I made no modifications to the rotor, but only to the controller to allow remote operation and position indication. I think this beast is basically the equal of a low-end Ham rotor. It should turn a 2 m beam no prob. Oh, I forgot to mention that the RPU antenna is designed for tower mounting, and is mounted on the rotor at the end! I've been meaning to get up there and put a bearing in between rotor and antenna. If you mount your beam at the center, it should work that much better.

I have one and use it when in the woods. It is almost indestructible.
I have noticed that it is not too efficient below 14 mHz but that
is not a surprise. Customer support is excellent. I bought mine used
and asked the US distributor for an instruction sheet. It arrived
promptly at no cost. They will sell you replacement parts but also
give you Hustler and Radio Shack part numbers for things you might need.
I have mine spring mounted guyed with fishing line. If I hit something
solid the fishing line breaks not the antenna. Other antennas are more
efficient but I doubt any are more durable.

6813. Re: HTX-202 questions

As follow up to Duffy most HTs use the belt clip as a
heat sink. I also add a 1/4" aluminum sheet to the HTs I
have in packet service all brands not just Rat Shack.
Running most any HT on full 13.8V power tends to heat it up.
Small radio 5 watts 30% to 50% efficiency in the finals no
big surprise here. Ask yourself do I need the full 5 watts then
try with less I think you will be surprised what 1 watt will do.

6814. re: MFJ Artifical Ground Work?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-25 00:00:00 UTC
From: Michael.Black@juxta.mba.org
Message-ID: <ce2_9507251330@mba.mba.org>
Source record: 214785

depaul@spk.hp.com (Marc DePaul) is having problems with RF
feedback and has heard that artificial grounds help. He was
wondering if anyone had used this device to solve this problem.

I've never tried one. The idea of an artificial ground does
appear to be sound.

WIth a dipole, you are feeding two sections of suitable length.
With something like a ground plane you are in fact doing the same
thing. At HF, you have all those radials that are supposed to be
of the proper length. At VHF the concept is more visible, since
if you made a 2M groundplane in the traditional fashion, you'd
have a vertical element of about 19, and radials of the same length.

If you don't or can't have a good ground, one way to improve things
is to have a counterpoise, ie a length of wire of the right length
for that band. It amounts to the radial in the vertical. OF course,
it can get unweildy, since at HF the required length can be considerable, and you need one
counterpoise for each band that you
want to operate on.

The artificial ground takes the concept one step further. Through
coils and capacitors, it shortens the length needed for the
counterpoise. I guess it could also do away with the need
for multiple counterpoise wires, since you can use the tuning
unit to make a single length of wire "artificially" the correct
electrical length for the different bands.

An artificial ground unit could in effect be considered an antenna
tuner. As far as I know, a length of wire is still needed for
the counterpoise, but it can be shorter and there needs to be
only one.

A glance at the ARRL Antenna Handbook turns up no entry for
artifical ground in the index. I don't recall seeing the matter
covered in a book. That doesn't mean it hasn't bean dealt with,
only that I haven't seen it or don't remember seeing it.

There was an article in 73 sometime in the past five or six
years. I don't think it was before that. It was in the fall,
and it was an issue devoted to QRP. It talked about the subject
of artificial ground, and included a circuit. It was meant for
QRP operation, though. It would need to be changed to high
power components for higher power operation. I am quite

sure "artificial ground" was in the title, so looking
through the year end index for the past 6 years should

turn it up.

This might help you determine whether it's worth buying
the MFJ unit. Or you might see how simple a device the
artificial ground can be, and build one yourself. the
only real problem is getting the needed high voltage
capacitors.

Unfortunately, the phone takes too high of a priority in most retail stores.
It really burns me up when the salesperson who is helping me, stops to
answer the phone. It is sort of like someone cutting ahead of me in line,
if you get my drift. Plus, too many callers have no manners when calling an
establishment - knowing that there are probably customers in the store, they
still monopolize the attention of the salesperson, by asking endless
questions.

I just had a bad phone order experience with AES right now. I ordered two items last week by calling their 800 number. The items were stated as in stock. I received one, with the other item back ordered. When I called back, the person I talked to said that was at another AES store ??. I thought I had called AES by using their 800 number - apparently the order got forwarded to a specific store. The salesman on the end acknowledged that he was in stock on the item but refused to deal with it - I had to call the store the order shipped from directly, Las Vegas.

OK, I called the Las Vegas store. The salesman told me that the item was backordered at their store. I pointed out that AES has it in stock elsewhere. He said OK, but I would have to pay additional shipping! I told him what I thought of that and he said I could talk to the manager if I wanted. I did so and the manager did offer to eliminate the additional charge and ship out of the other store.

The kicker, I thanked him for resolving it and then pointed out to him that 1: AES had said they were in stock and then backordered it, 2: AES actually had it in their system, but did nothing to transfer between stores, 3: the two salesman I talked to had "its not my problem" attitudes, and 4: there was a thread on Internet trashing AES right now, and AES ought to be sensitive to the service issue. His response? "Yes, I have seen that thread, and I have also seen the mentions the other stores get." Translation: "Its OK for us to deliver bad service, because the other stores are rotten also"!

On another note, I have good experiences at the HRO store in Van Nuys now Burbank with a specific saleman, but a negative experience with the manager. So much for taking it up with the manager.

I spoke with Icom Tech support yesterday and they said "late August". Said
that all they were waiting for was fcc approval. Which I find interesting
in light of the comment made about a demonstration of the rig at an L.A.
ham store. Can the thing be "out there" at all w/o FCC approval? Maybe as
long as you don't transmit on it you're okay hi.
An added note however, AES in Milwaukee said that they are not expecting
the 706 out until Oct/Nov...fellow I spoke with said all they wee
expecting was the "window" of '95.
Looks like a neat rig though!

>The circuitry needed for 800 has been omitted from the radio as of the
>production change.
> Milt, K9QZI

It appears that Yaesu has omitted just a very simple part. I just modified my new FT-530 by cutting the green wire. It shows 800 MHz but the reception is very poor. (I used a signal generator and verified that the radio IS receiving), Maybe all they did was remove a capacitor on the 800 MHz path. Does anyone know why I can't enter a frequency for channel 0 on any of the bands after modification?

I have ordered many things from AES and have always been satisfied. As
a salesman in a store I can also relay the frustation with people who
just sort of look around and ask questions about this or that and don't
buy anything. The salesman has a family to feed and keep a roof over
their heads. They don't have time to bottle feed you!

Fellow Yams,
I would like to convert a commercial Maxon HT
(model CP-0520 UHF) to the hambands. I'd like to
talk to anyone that has tried this conversion
(sucessfully or not). I'd also like to get a
copy (photocopy OK) of the manual and schematics.
I will, of course, be happy to pay copying and
shipping costs.

Thanks!

Sorry Keith, old buddy, but you're forgetting the most important aspect
of good salesmanship - pleasing the customer. If it takes a lot of
looking around and asking questions before he/she plunks down a couple
of thousand dollars for the latest ricebox, so be it. Maybe it's that
kind of attitude ("I don't have time to bottle feed you!") that is making
catalog and online sales so successful...the salesperson is taken out
of the loop. And if they stay out of the loop, how's that family gonna
get fed and that roof stay over their heads?

So please have pity on all those "frustrating" people who "look around
and ask questions about this and that" while they're in your store...
remember, they might be paying your salary!

6829. Experience with SGC ?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-25 00:00:00 UTC
From: Gerald Schmitt <ggs@aerie.lanl.gov>
Message-ID: <3v3432$sck@newshost.lanl.gov>
Source record: 214800
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.antenna

Has anyone any experience with the SGC QMS system? I was
going to built one but recent experience has put me off
for the moment.

For some time I have owned the SGC-230 tuner. At a hamfest
over the weekend I acquired the SGC-303 antenna with the
insulated spring and ratchet mount.

Now I had most of a QMS system so I gave SGC a call to ask
about buying the tin box to put the tuner in and complete the
QMS system.

Keeping in mind that the tuner lists for $595, the antenna
system lists for $495, and the entire QMS system has been on
"special" for $895 for the past year; how much could the tin
box be worth? I don't know how much it is worth but it costs
a whopping $490.

Considering what I have heard from the California Shoot Out
it may not even be worth pursuing the SGC system but the auto
tuning is attractive on long hauls. I am particularly interested
in a system that can move from vehicle to vehicle without scuffing
up the finish. Any input will be greatly appreciated. Any input that
precludes paying SGC exorbitant prices will be particularly
appreciated.

I am under the impression that the Shoot Out was on 75m, a band that Mother Nature never intended to be used mobile. :-) The Shoot Out would probably have a different outcome if it were done on 15m. I don't know anything about the QMS antenna. I use the SGC-230 and a 13 ft whip for multi-band operation 10m-20m. The longer-than-quarter-wave length on 10m-15m gives it gain over a bugcatcher which has been verified by field strength measurements. It is one 'S' unit down from a bugcatcher on 40m.

W5GYJ uses a bugcatcher with an SGC-230 and puts out a heck of a signal. The advantage of such a system is the antenna only needs to be close to resonance so the entire band is always available and the bottom matching coil can be eliminated.

Source record: 214655

atanner <atanner@infi.net> figures that 73 must have an
email address or web page, and wanted someone to post it.

Why not do things the way things were done before there
was the Internet. Go to a newsstand, buy an issue of 73,
and look carefully through it until you see a sign of an
email address. If you're real cheap, just read the issue
right there at the newsstand.

If you see no sign of an email address, either there isn't
one or they don't want it well known. You could always take
the phone number or address and contact them in a traditional
way and ask them if they have an email address.

Libraries are also a good place to look for information that
you don't want to pay for.

I've never seen any mention of a 73 magazine WWW page. Wayne
Green has an email address, but if you'd been reading the magazine
lately, you'd see that he doesn't like getting email and probably
has not publicized it. I'm sure I have seen an email address
for the editorial staff in general, maybe a Compuserve address.
This was fairly recently. You can look for it as easily as I can.

I've had bad experiences at both HRO and AES. I've also had _good_ experiences at both stores. They both have given me excellent service for mail-order, (though I usually decide what I want before I order, hence no returns).

AES, until the dollar went into free fall, had the guts to actually print prices in their catalog. I expect that they will return to that policy when the dollar stabilizes against the yen. This puts them a notch above the average in my book.

HRO is my local store. They treat me pretty well. I'd rather that they act like human beings than like the public-relations automatons you see at McDonalds and Wal-mart.

My 2 cents

Source record: 214667

I just discovered that the [vwx]21A extended frequency mod also works
on the T21A. But it appears to have slightly different results and I
would like comments from others who have tried it.

First the mode itself: Turn off the power
Hold down # and B
Turn on the power
Do not release the keys until after the beep.

What this gives me is dial range from 10 - 329.90 MHz on the low band
and from 330 - 999.90 MHz on the high band. That's mighty impressive
if it even comes close to being its true receive capacity.

There are several other changes that occur:
DSEL alows you to select any of the right four digits.
PLACE is a new set function that selects how many digits you can
type from the keypad.

The rest of these I'm not sure of and would appreciate comments on:
FM1AM is a new set function that has "HAND" and "AUTO" as options.
I would guess it has something to do with whether signals
are interpreted as AM or FM, but I'm not exactly what.
U now appears briefly in the memory # place after selecting
low end frequencies. The border is around 61.275 but it
is not consistent. I have no idea what this means.
The M in the lower left portion of the display turns on between
108.00 MHz and 135.995 MHz. The marine band?

That is all that I have noticed so far. Any information about what
some of these things mean and what kind of reception can be expected
in the various ranges would be greatly appreciated!

Enjoy,
KC5OPQ

>I am thinking of picking up a used ts140...does it work okay on
>amtor/pactor etc? Any comments would be appreciated!

Many late-model rigs have an "FSK", "RTTY", and/or "PACKET" button on
the front which will use the rigs FSK filtering etc to work with the digital modes...
however, the local ham store sure sells a lot of the 'connect to the mic'
wiring harnesses which essentially run the digital modes thru the mic jack
in lower sideband mode (thus, ignoring all the digital features). My Kenwood 950
ignores all input from the mic if I put it in "FSK" mode. Wiring the DIN connector
on the back is a nightmare...(why they can't put in an easier connector I'll
never know)...

So in summary...I've seen successfully amtor/pactor on rigs such as the
Tempo-1 and NCX-3 (both 20-30 year old rigs) using the mic jack...the
TNC has pretty good filtering itself...a Kenwood 140 would work fine.

Just one ham's opinion...73s..Doug.

Hi Fred!

I have had a Japan Radio JST-245 since the end of last year. I worked as an engineer for R. L. Drake back in their salad days as an amateur radio manufacturer in the late '60s and early '70s. I think it is a high quality radio designed with a little less compromise than most other amateur products in terms of the selectivity distribution and attention to some of my pet peeves (such as wide band hiss in the audio).

The most telling comment I can make is that after one of my friends from the old days at Drake (who is now one of their tech execs) used mine for a few minutes, he promptly bought one for himself.

To be fair, we are both 6 meter DX and weak signal nuts (I worked 9 new countries this summer with it so far) and we both like the 150 watt 6 meter drive for our "L6" pairs of 3-500z amps.

Bottom line: I bought one and I'm very happy with it.

Would anyone be able to identify the RF, mixer and oscillator transistors used in the Zenith 3000-1 receiver AM stages.

They are germanium PNP devices according to the schematic, but a type or equivalent is not indicated.

Please reply to cschmutter@bcit.bc.ca

I have the modification sheet fto allow crossband repeat on the FT5200, but no instructions. I am interested in one-way repeat. If someone familiar with this operation on the 5200 could provide details, I would appreciate it.

6853. Re: Experience with SGC ?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-26 00:00:00 UTC
From: Bill Harwood <harwood@sirius.chinalake.navy.mil>
Message-ID: <DCC6ss.BHy@avalon.chinalake.navy.mil>
Source record: 214674
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.antenna

I am very disapointed with the 230 & 303 combination. I have had excellent luck using the 230 with Hustler and Pro-AM multi-band antennas. The 230 provides the band width to allow changing frequencies without adjusting the tuning. The best performer though is an 230 with a SPIDER top loaded antenna. It will exceed the performance of anything in the shoot out on all bands except 80. On 40 it is about par. The Navy did a lot of research in the 50's and 60's which proved that top loading is the best for a short antenna. One place I do use the SGC303 is for off road 4X4 work. I have a quick mount on my SPIDER and 303. When I leave the pavement I pull over and switch antennas. The mutiband loaded ones are just too heavy to ballance around and survive.

Good Luck,

Bill Harwood

Hello Dear Netters,

I am looking for hand-on experiences with JST-245 and IC-736. I have been used IC740 for some 10+ years. I have been working on mostly SSB/RTTY from 3.5 through 28 also some 29MHz FM. I like RTTY and PACKET and wish to drive a cheap 1000W linear amplifier with new rig.

Please comment on above rigs and/or comparable rigs in the range of $2-2.5k

Thanks, de HL2AMO

>1) Do these symptoms sound like they are characteristic of this radio?

Yes. I have had a few 470's and the audio output is a weakness. It is
not very loud and distorts easily.

>2) If it needs repair, does anyone have a good recommendation. I live in AZ.

I don't think so. THere is a little board you can stick inside to up the
audio output, but the speaker still stinks. I always use a good quality
speaker mike, or an external speaker when I want to hear it much. That
works fine.

6857. Re: What resistor to use as a dummy load with QRP rig?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-26 00:00:00 UTC
From: Michael.Black@juxta.mba.org
Message-ID: <dfb_9507270030@mba.mba.org>
Source record: 214678

George Guillory <guillory@phoenix.net> said:
" Isn't the traditional dummy load for a QRP rig
a nice big light bulb?"

Well, that is what they used to suggest back in the old
days. I remember seeing the idea in a book about
two-way radio servicing from the early sixties that I
found in a used book store.

But just because it was suggested in the past does not make
it a good idea.

It does provide a load to the transmitter so it isn't
going into no load, which could damage it. But a lightbulb
does not present a fixed load, or a load of a definite
impedance. The filament is like a coil of wire, and depending
on the band, what it looks like to the transmitter will
change. Even if it it did represent a fixed impedance, one
that you could determine, it wouldn't be a good choice because
the resistance of the filament changes as more power is put through
it.

So a light bulb might be okay at a very rudimentary stage, say to
see if you are getting any power out. If it lights, you'd know
something was there, and the transmitter is somewhat protected
from a no-load situation. But when you start tuning the transmitter,
you are feeding a load that will change as you make adjustments. So
you adjust some more, and the load changes again. Not a good situation.

One of the reasons for tuning into a dummy load is to make adjustments
off air. But since you don'
have a load that is close to what the antenna is supposed to be,
you'll end up having to retune things anyway.

Another point against a lightbulb load is that it is unshielded.
A light bulb may not be a great radiator, but nevertheless it
can radiate, and there goes your signal out into space. SOmething
you want a dummy load to prevent.

Other than cheap, the only good thing to say about a light bulb
dummy load is that it provides a visual response to the power
being put into it. Maybe once that was a consideration, but
nowadays you can come up with all kinds of schemes (especially
at the qrp level that this thread is about) to indicate the
power into the load, or even relative power. If you just go
for a relative power indicator, it is right away better than

the light bulb since you know that it isn't changing as you
tune the transmitter, so any increase in the indicator is
due to a better match to the dummy load.

>>heat sink grease between the belt clip and the heat sink (the back of
>>the radio). It will much improve heat transmission from the heat sink to the
>>belt clip. I experienced good results with this method, as have several folks
I guess I should've thought to mention that the troubles I had were when
running off the vehicle's power while moving. Running 5.5w constantly to drive
my 440 amp. The radio would become very hot and shut down. Installing the
belt clip helped quite a bit, adding the heat sink grease improved it even
more. All electronics gadgets need to dissipate heat. An important, but not the
only factor in dissipating heat is surface area. As toys shrink. and power
levels rise, the difficulty in getting rid of heat becomes critical. These days
I find myself doing very nicely on 20mw to 500mw into mountain top repeaters.
Or I'll stress antenna gain-hieght-cable quality to extremes to keep power
down. The radio will live longer the less it's stressed by overheating.

>people just calling around to get the best price? Or morons, asking what
>the store hours are?

I'll agree that not every phone call is a sale - maybe 20-30%, by the
time you filter out the hours, in-stock queries, the how do you design
a xxxxx box, the can I use a CB antenna on 2m queries, etc.

But some calls are for real. The best example of bad vs. good phone
service is my own. I was looking for a new radio - at that time it was
a toss-up between a Yaesu 708 and an IC-04 - I called up HRO Van Nuys
and HRO Anaheim. I called up both and asked if they had one of each
ready to demonstrate? HRO Van Nuys said no. HRO Anaheim said Yes - and
on top of that offered the fact that they had fully charged batteries
for each radio available in case I bought one (i.e. I could drive away
with the radio ready to talk). I also asked what would the price of the
radio be with a drop-in charger and two batteries (probably a pretty common
configuration, I'd say). Van Nuys went "Duhhh, let me figure it out."
When he got back to the phone he gave me a number. Same questions to
Anaheim resulted in an immediate query: "In Calif. or out of state
resident?" and gave me the right answer immediately (Van Nuys had
forgotten to add sales tax) - almost like he had a list by the
phone... And offered to check the charge on a couple of batteries
for both the Icom and the Yaesu on charge so they'd be "full up" when I
got there - no matter what I bought, if I bought...

The drive was twice as long, but guess where I bought a 708? Anaheim. But
the odds on getting a knowledgeable salesperson on the phone on the
first try have gone downhill since. A while back I called looking for
a set of the four books by Cynthia Wall for a birthday present for a
young ham-wanna-be. I know that HRO carries them - I saw a couple of
sets at HRO Portland (OR) a few months ago. I was going to be in the
Anaheim area a few days later, soI called Anaheim. Do you have a set?
"Not sure, you'll have to come in and check".

I'll see Cynthia at the SW Convention in a couple of months. I'll buy them from her - and get them autographed to the person at that time. For less money that I would have spent at Anahem. And I know she'll greet me with a smile in her voice and be happy to answer questions.

My contribution to this thread comes from long discussion (not on the store 800#) with friends in the Ham Radio business. Basically, nobody is making much money selling equipment to hams- we it seems are trained by somebody (like QST, 4/95) to call every dealer in the book to save a few bucks. This tends to lead to huge numbers of calls (which cost each store $$) and the price is whoever gets closest to zero profit, just to sell something. Between the low retail margins, and the Yen vs. Dollar situation, I am every day surprised we have as many suppliers to our hobby as we do.

---SNIP---

All the better reason to buy from Ten Tec. You don't have to call around to get the best prices, you don't have to worry about the Japanese Yen, and you don't have to worry about Jerks.

>>Yes, that is perfect. Just be sure it's a composition resistor, and not wire- wound. The wire-wound resistor is inductive, which will make it a reactive load.<<

That may be a big task. Most carbon resistors are now have a big spiral of carbon inside the resistor. One company I work for has a requirement for non-inductive resistors and they come from a single source at a premium price.

Metal film resistors offer the same problem.

Most of the time and for HF use the inductance is harmless, but I would still measure a resistor. Most 47 ohm 2 watt carbons have a noticable bump at 30 MHz, and the higher resistance resistors are worse. The biggest problem is using these resistors for parasitic suppression, but they can also make poor dummy loads on ten meters. 73 Tom

The reality is that the Radio Shack does have a good notch filter, and can help on CW if the receiver used has a wide CW filter. The other functions don't work at all. It certainly is worth 50 bucks if your receiver has a wide (500 Hz plus) CW filter, or if you want a heterodyne notch. If you want enhanced S/N, truly narrow CW, adjustable CW pitch, or significant SSB selectivity improvements you would only find them in a more expensive filter. 73 Tom

I recently went through a move. Upon unpacking my TS120, I decided to power up and shove my 10 Meter whip out the window to see how many TV's I could slam to get the real good first impression with the new neighbors. As I plugged my rig onto the power supply and cranked it up, I noted that the only thing on the display was a single '.' where the decimal point normally is.

Thinking something probably got jarred in the move, I tried flipping the band switch. It tried turning it off and back on again. I tried keying into a dummy load for a split second. I tried a great number of things but could not seem to get it to work. I ran out of time, and set it down for a "do later" task.

When I got back to it later, I actually opened up the case for a spot inspection. Did not find a thing. Pulled out the VFO. Did not find a thing. Finally I decided it looked like a job for the repair shop.

This morning, I woke up and decided it might finally (a month later) be time to take the rig in and get it check. After packing it all up, I decided, "well, maybe it might be a good idea to check it real quick." Without even taking it out of the crate it was packed in, I hooked the wire up to the power supply. Powered up, still the same '.'.

However, now that the rig was facing straight up, I was able to notice that there was a button pushed in that was otherwise hidden slightly under the VFO vernier knob with where I was initially setting the rig. Rather ironically, this button was labeled "FIX". (for those of you unaware, this button is used with external tuning devices such as the DFC-230 or with an internal crystal - when nothing is plugged into the rig to give you a frequency, all you get on the display is a '.'. It had been so long since I used this without something plugged in, I forgot all about that fact)

Of course, pressing the FIX button did in fact "fix" the rig....

Doooohhh!

>
>Has anyone heard or used this device for this application?

The artificial ground is nothing but a counterpoise tuner.
That can be useful, but it's better to solve the root cause
of the RF floating in the shack instead. This is almost always
the result of a non-balanced layout. Fix that, and you won't
have RF in the shack.

Now if you are using an end fed wire, you'll have an inherently
unbalanced setup. A counterpoise can help here by making the
station the feedpoint of a balanced antenna (with the counterpoise
effectively substituting for the missing half of the antenna).
Now if you can't *physically* run a counterpoise of the correct
length, then the artificial ground tuner can help. Otherwise,
its a waste of money.

>suppliers to our hobby as we do.

Amen to that. I know several salesmen who work for HRO, AES, etc,
and they've all told me that it is corporate policy to give the
telephone priority over in-store lookers. The reason given is that
a phone call is more likely to yield a sale, and that a missed
phone call is a missed sale because the person on the other end
will just call another 800 number. Meanwhile, if you've got a sucker,
er customer, in the store, he's more likely to be patient than to
waste the drive he's made to your store, IE to put it more politely,
you can put your in-store customer "on hold" with less likelyhood of
a lost sale than missing answering the phone.

That doesn't excuse rudeness to in-store customers, however, and the
better salesmen at all the stores realize that. But there do seem to
be a number of jerks working for all these storefronts. If you do find
a good salesman, stick with him while he has to run to the phone. It's
not his fault, and the time he has spent with you should be worth some
patience in turn on your part.

The Atlanta HRO is no different than the others that have been
described here, the telephone rules, and the staff is often
harried. I still go there and wait for John to be free, however,
because he's always bent over backwards to be helpful to me.

We recently got our 224.300 repeater back on the air. But we did wind up spending a fair penny to do it. We came upon a system offered in the rec.radio.swap group. We're now running an Icom RP2210.

Previously we were using a Midland 13-509 mobile. These radios are easily turned into repeaters by seperating the TX/rx boards into their own RF tight enclosures. Add in a COR circuit, a duplexor, antenna and power supply and there you are. The problem was that our site was rather intensely "radio-active". And the 13-509 is a very cheap radio with a very cheap front end. So basically we just had very nasty intermod troubles. Anything could key that thing up. And the Tx was less than clean as well, with some strong harmonics that would kerchunk other repeaters in the building. I have heard of people rebuilding 13-509's with tighter front-end circuitry and better filtering on the Tx. But I've no info on it.

A friend, who was once our Control Oper, speaks of converting Micor mobiles from VHF Hi Band to 220. He estimates about 100hrs skilled labor to recut the coils in the helical resonators along with quite a few other circuit modifications. You may actually find some references to converting Micors to repeater use at the FTP site: oak.oakland.edu//pub3/hamradio/mods/motorola. At least I'm sure I've seen some files regarding Motorola Micors there.

By the way, don't want to sound overly negative about using the 13-509. If you have a site that's relatively quiet, with little intermod concerns, you might do just fine with it. Our old one may be going to a fellow some 50 miles to the south of Tucson. But if he decides to use some other gear, I suspect we'd offer it in rec.radio.swap - cheap!

>I need to carry a handheld radio whilst skiing/bicycling. Preferably under
>the neck or on side of torso.

When I used to be a ski patrol, we carried the radio in a pouch on our
chest. The pouch had a loop around the neck and a an adjustable waist band.
The radio would be cocked to one side (usually to our right) so the antenna
would not poke us in the chin or the eye. That way we could hear the radio
well and when we wanted to transmit, we did not have to take the radio out of
the pouch. Side of a torso was a no-no, as it may cause more injuries in a
spill.

Good luck..

> Thanks for your time!

The 150-170 Mhz Motorola Micor mobile converts to 220 just fine.
Look on the latest QRZ CD-ROM in the mods directory.
It will put out 25 watts all day. If you need more, you'll need an
external amplifier. Don't skimp on that one - get one made as a
repeater amplifier with lotsa cooling.

I do not have the article handy or I'd email it.

>>>>Some time ago, I had seen mention of the possibility of converting the Dentron MLA-2500 amplifier to use a 3CX800A7 tube instead of a pair of 8875s (which cost more than the amplifier is worth). Does anyone have the details about such a conversion?

Thanks in advance.

73,
Bob K2PH<<<

Bob, You would have to add a seperate filament transformer, electronic grid protection circuit (a fuse will NOT do), and make air system modifications. The 800 has a coaxial anode cooler instead of the transverse cooling of the 8875, and will require a high pressure blower rather than a fan.

Dentrons also were a bit off for tank values, so you might look at the electrical value and size of the tank components. Errors there won't hurt much except for harmonic supression and matching range, but you may want to correct them.

Hmmm.. At SeaPac (The NW Convention) in June, the Icom Rep said it was
going to be priced at around $1400.

Does anyone have suggestions for multi-channel radios on the 900 MHz ham band. The first choice would be something frequency agile and the second would be a unit with several channels. What commercial units, mobile and hand held, can be programmed into the ham band without extensive modification? Most of our hams want a clean looking unit, not something we cob up form pieces and looks like it. Are there any foreign units that would do this? Other countries use this band for CB, trounced and cellular services. We would like to stir up interest in 900 MHz in our area but need a viable source of radios.

Thanks,

Bill Harwood

Cecil

The above is a very important part of a base mounted tunner. Many of our
experts seem to fail to grasp the importance/convenience of this. This
type of tunner has been used on aircraft for years. And if one is a
camper another 20 feet of wire tied from the whip to a tree makes a
"Pretty Good" Low band antenna.

I recently purchased a used FT470, and overall I feel that it is a pretty good purchase. However, two things I don't like relate to audio. The first is that the volume, even full blast, is not very loud. The second is that the audio sounds 'crackly', leading me to believe the speaker may be damaged.

1) Do these symptoms sound like they are characteristic of this radio?

2) If it needs repair, does anyone have a good recommendation. I live in AZ.

Hi there.

I'm trying to find out if anyone knows about or has ever owned one of those Tokyo Hi-Power 500W (or so) linears that used to be advertised in Ham Radio magazine in the mid-'80's. These amps were unique in that they used two 4CX250's and were extremely compact units.

I know that THP pulled out of the US market several years ago when their rep in Plano, TX went out of business. What was the model number of this amp and some of its performance specs? Are these amps available in Japan or over here in a different guise? How much are they worth?

Please e-mail responses. Thanks in Advance!

Hello all:

Anyone out there replace the silly designed Kenwood power supply
fan assembly? I recall someone suggesting a high grade computer
power supply fan replacement with a small modification to the metal
housing, but don't remember who.

Anyone do this? Besides fitting the fan into the metal housing, are
there current considerations? Did you wire around the thermistor
and just run it flat out whenever the radio was on?

Fishing for info :-) .

Add a Plectron or Motorola Alert
Crystal Controlled Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They can be powered from | 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly. The Plectron 500 series is less desireable.

I use 6 Plectrons in my living room, 7 Plectrons down the basement and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks down downstairs. Power to them is controlled by modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I fixed and restored each one, recrystalled them on local frequencies, and distributed them to members of my scanner club who were glad to get them.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain. | Plectron receiver repair service is offered by:

Woodson Electronics/Plectron |
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985 |

Some replacement parts are currently available from Federal | Signal in University Park, IL, phone (800)524-3021. | Woodson is negotiation with Federal Signal to be able to | sell replacement parts for older Plectron receivers. |

Alert Monitor parts are available from Motorola. Phone | (800)972-3226.

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

6913. IC737 Autotuner stretch to 4013.5 Khz Help

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-27 00:00:00 UTC
From: rsmith@internetmci.com
Message-ID: <3v8umo$h3v@news.internetmci.com>
Source record: 214578

Have an unusual (hopefully not) situation. I am in Navy Mars
NNN0SZDT.

I have a ICOM 737 (Not A) that transmitted at my net frequency of
4013.5 without any mods. The problem was that it would not
autotune there off of my G5RV.

What is perplexing is that 3.5000-3.999 and 4.060-4.999+ will
tune just fine. Thought it might be that I would need to make
the TX mod so I did it - absolutly no change. Is there an
adjustment I can make to cover this 60kHz or so this seems to be
missing based on microprocessor programming.

Thanks in advance for any help.

> right there at the newsstand.

What an interesting idea. However, upon thinking further about it
I realize that it would be immoral to do so. Firstly, the proprietor
of the newstand would be out a sale, which would lessen the demand
for copies of the magazine, perhaps causing the store to no longer
carry it. Thus reducing the need for drivers to deliver the magazine
to the store and possible loss of a job. There would be reduced
demand for paper which would place many people out of work, although
I suppose the lakes and streams and the air might be healthier. The
printer would be deprived of the additional work and perhaps laid
off or at minimum reduced to part time employment.....

The consequences of my action would reverberate throughout the entire
industry causing unpredictable and almost certainly unpleasant things
happen to many people.

No, I'll buy one. And I wanted the address so I could ask if they
accept subscriptions via email or a web page.

Hey wayne......

I just had to reply to this message about the Multicom Software. This
Software is VERY VERY BAD and it was a big waste of money.

I do like the MFJ-1278B and the MFJ-1270C very much. Both are very
good units. (But do not get there software!)

6919. Info on 2m Mobile?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-27 00:00:00 UTC
From: danb@acme.csusb.edu
Message-ID: <3v7cio$hts@news.csus.edu>
Source record: 214687

I'm considering the purchase of a 2m FM mobile radio, for primary use as a base unit. Since I work at Radio Shack, I've been exposed to the HTX-212, which seems like a decent piece of equipment. However, I'd like some input on other similar items, particularly the Yaesu 2500.

A feature that I appreciate on my HTs is direct frequency entry. Does the Yaesu have that? What about ICOM, Kenwood, etc? Any input/recommendations would be appreciated. I'm looking to spend under $350 on the radio, but I'm a little flexible on that figure. Thanks!

Source record: 214688

I had two of these and recently sold one. The programming on them is different from the big three, ie Kenwood, Icom, Yeasu. In other words, it stinks, or Im just a slow learner, take your pick. After you get used to it, it's ok. On the the positives. Good clean audio out, nice size speaker so easier to hear in the car than the really small 2 meter HT's like are sold these days. The keypad buttons are large and easy to use. It seems to be pretty durable. It is nice that they include a desktop charger. Actually, you have a wall charger type plug in and the part that sits on the desk is more of a charging stand, but it works great. I have had the one that I have now for about a year and have had no problems with it. I have had it apart to see if there were any way to mod it to xmit out of band, and although I did not actually make any mods, I got to see that the quality of the way it is put together is the same as any other the other HTs that I have had. It looks fine. I paid $300 to a friend of mine for it. New they are $369
If I could not find a used one, I would pay the new price for one. Hope this helps. John KO4MY,

Source record: 214692

Fred, KE0ZG, wrote asking if anyone had a word of wisdom on
the JRC JST-245 HF/6 meter transceiver.

Here is my words of wisdom:
I think that 'any' rig produced now is very good. The equipment
of the 90's are all first rate when compared to the stuff
in the 70's. But when you buy an 'Orphan' rig like the JRC, don't
expect to get must resale value on it. My experence is to stay
with the main stream manufactures, Icom, Kenwood, Ten-Tec or
Yaesu. I know the ad's look good, I bought a Yaesu FTdx560 transceiver
from Spectronics (this is before Yaesu America came in) and I had all
kinds of troubles with service, parts and sold it for nothing just
to get rid of it. Wonder how many KDK 2 meters transceivers are
still out there without serivce.

Those are my 'words', any other opinion's?

6929. NEED HELP for ICOM IC-W21

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-27 00:00:00 UTC
From: bernardb@hp800.berclain.com
Message-ID: <3v8ceq$1bv@clic2.qbc.clic.net>
Source record: 214697

I've found some undocumented behavior while trying to get my ICOM IC-W21A do cross-band repeat operation. Now I can get into a mode that make my radio retransmit in UHF what it receives in VHF, but only in this direction. Also, long ago I unlocked some functionnalities (i.e. expanded reception coverage) using "software method" (using keypad) but I can't how to redo it again.

Does anyone know these and other undocumented features for this model? I would really like to get this info!

Replies may be sent to bastienb@berclain.com

I figured out a couple more of the extended features:

sbnoble@cindy.cs.uoknor.edu (Seth B. Noble) writes:
> FM1AM is a new set function that has "HAND" and "AUTO" as options.
> I would guess it has something to do with whether signals
> are interpreted as AM or FM, but I'm not exactly what.
> The M in the lower left portion of the display turns on between
> 108.00 MHz and 135.995 MHz. The marine band?

The M indicates AM reception. When FM1AM is in AUTO mode, AM is
used in the range described above. In HAND mode, you can toggle
between AM and FM by pressing [FUNC]-[MONI].

Of course the set does not transmit out of band. Pressing [PTT] while
outside of the 2m band displays OFF. I doubt that there is a software
mod for that. Maybe a hardware one but I personally would not dare
fiddle with electronics on this scale.

I have been able to receive signals between 130 and 500 MHz. Below
130 I haven't gotten more than a few bits of static. In particular, I
don't get anything in the FM radio band. I am using the mini antenna
that came with the HT so I suspect that is the trouble. I'll try
getting FM radio once I hook up a longer antenna. I have not
throroughly scanned above 500 MHz yet.

Cheers,
Seth

Volume. When margins are thin, the only way to make money is to move large volumes of merchandise. Consider the gasoline retail business. The profit per gallon is low, so the road to success is to move a lot of gas, and having a filling station on every corner can help do that. (Obviously there's a limit case where it costs more to open another outlet than the increase in volume that additional store can generate justifies.)

I am looking for a service manual for a high pwr UHF Motorola Mitrek. The unit is presently on 463.300 MHz, if this helps.

Yes I already know I can get anything for this radio from Motorola, so please don't send me their 800 number--I have it. A used book from someone out here would be sufficient.

Also can someone direct me to where I can find the mods for full duplex operation for the Mitrek? Nothing seems to be on the Oakland FTP site or a few other sites.

Any help finding these two items is greatly appreciated.

Hi,

A pet project that I have at the back of my mind needs a cheap positioning system, and I am looking at Loran-C as being much better suited to my purpose than GPS.

Why ? Because it is cheaper, has adequate accuracy, uses 100kHz technology that is much easier with antennas (I dont need care to point something up etc.)

I am looking for a bare-bones Loran-C reciever -- all I need is for the reciever to give me TSD or even mere signals for pulses ... I can take it from there and have my software do all the math.

And I want it to be small, as small as possible ... I will be wearing it on my hip all day (with my hp100lx) ! (Coming to think of that, maybe I should talk to some vendors who make migratory animal tracking gizmos that use Loran-C ... would be grateful for any phone numbers here!)

Any Loran vendors I would benefit talking to ? I would be grateful for any phone numbers.
Any tips ? Thanx in advance.
Any other ideas .. suggestions however bizzare ?

TiA !

X.400: G=Shrikumar S=Hariharasubrahmanian P=itu A=arcom C=CH --------------+

PS: I was first toying with an idea of grabbing cellular base station id's off the air, and using look-up tables to map the base I am in the service area of to geographical location. But dropped that idea since cellular phone units are not _that_ cheap, and are very hard to hack through to get such info as base-stn id from under layers of AMPS protocol, even if available etc, and even then I would need to update base stn location maps often. -- not practical.

>Hi,

>A pet project that I have at the back of my mind needs a cheap
>positioning system, and I am looking at Loran-C as being much better
>suited to my purpose than GPS.

I disagree with your assesment. Number 1, Loran is not significantly
cheaper than GPS. You can pick up a GPS for as low as $300. The lowest cost
Loran is around $200. Number 2, I have not seen a battery operated Loran.
Yes they operate on 13.8 v. but their current drain is probably too high.
Number 3, US Coast Guard is dropping off Loran service in not too distant
future. Number 4, Loran does not have the coverage GPS has. Number 5, how
did you determine Loran has better accuracy?

You can buy GPS receivers alone and program the logic yourself, several
manufacturers even make models that you can slide into a computer slot.

Good luck anyway.....

6938. HTX-202 and Customer Service

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-28 00:00:00 UTC
From: harrisok@vax.sonoma.edu
Message-ID: <1995Jul28.012048.1@vax.sonoma.edu>
Source record: 214583

Well... In all fairness to Radio Shack, I have to update you on my friend's experience with the company.

My friend bought his HTX-202 at Pacificon in October of '94. His HTX-202 quit on him about 2 months back. It stopped transmitting.

This friend is rather young and has not learned to exert himself in the field of customer satisfaction and was all prepared to sell the radio for parts so he could get a different radio. (You see, he had lost his receipt that proved when he bought the radio...)

Enter another ham who knows a Radio Shack manager fairly well... Bill tells the manager about this young ham who got his 202 from Pacificon and the manager says "Wait a minute-- I'm going to call the district manager and see what we can do."

The district manager says "Is that the young man who had a cast on his arm?" "Yes," is the answer. Well, the district manager remembers him and verifies that he bought it from Pacificon and says "send the radio back to us so we can fix it."

It has taken about a month, but he now has his radio back. The RS store even allowed him to purchase the extended warranty this late in the deal.

With all the threads going on regarding customer service and radio dealers, I thought this would be a refreshing example of how a company should deal with a customer.

6939. Hamfest Near OKC?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-28 00:00:00 UTC
From: af4s@bcfreenet.seflin.lib.fl.us
Message-ID: <3vajnh$cds@bcfreenet.seflin.lib.fl.us>
Source record: 214584

Will be in Oklahoma City over Labor Day weekend, Sept2-4. Wondering if
there are any hamfests within a couple hundred miles of OKC that weekend?
E-mail is ok

>>>buy this transmitter plus associated vfo and am wondering if this is a decent
setup for a novice on the 10 meter voice band. If I recall, this is an AM transmitter, not SSB, right? Is this a good combo on the cheap for that novice band? If not, anybody with any suggestions of good, inexpensive voice
transmitters for a novice? Thanks in advance. (I hope I haven't double-posted this message, aol can be reeeeel slow at times!)
Bill Vanstralen, KA9HLN billv21572@aol.com<<<

It's a good CW TX Bill, but controlled carrier is not exceptionally good for AM. But who wants to work AM anyway except CB'ers and nostolgia buffs? SSB is much more effective and takes up much less room. So I guess the 60 is a good CW only rig!

I think that is why I bought my Ten-Tec Paragon II back in April. I remember calling AES years ago looking for help when trying to choose an HF radio. The salesman said he would not make any recommendations and to go to a hamfest, pick out the radio I wanted, then call them to order. Needless to say AES could kiss my antenna as power was applied.

Anyway, I called Ten-Tec several times before making a purchase. I would fax them questions, and talked to them on the phone to ask questions. When I faxed them questions, I would get a faxed, personalized response. They always took plenty of time on the phone. Never hurried me nor did they ever seemed pained by my questions.

The day I was ready to buy, I called Ten-Tec and said I was still unsure which rig to purchase, the Paragon II or the Omni VI. He asked me questions as to my use of the rig and suggested that I buy the Paragon II (not the more expensive Omni VI). I bought it and I am VERY happy.

Now I know why Ten-Tec's business has doubled since they started selling direct and not through dealers like AES.

They might not be making the profit they want, but don't be fooled,
their making a good living.

The real question is why do people call around for the absolute lowest
price? If there is no value added by the store, go for the lowest
price. What I mean is that if the salespeople are not going to help
you, and if all they want to do is take phone orders, they why pay a
premium price? I am probably different, but I'll pay a bit more if the
salesman provides me with assistance. If they earn my business,
they'll get it and I'll be happy to pay a little more.

I have had the NIR 12, the latest MFJ, the Radio Shack and the Timewave. The MFJ is by far the BEST for serious HF operators, there is no comparison to the others. If you don't like it, you can always get a full refund.

I like the fully adjustable CW filter, the memory storage and the spotting tone most of all in the MFJ.

I think they are all good products, but I'm sure N0DH doesn't. He spends all his time trashing MFJ! While some of their products are cheap or poorly constructed, I think blanket critisism of every product they make is a stupid tactic.

Jeff:

My friend has one, I have also used it frequently. It is a bit awkward to =
program, but isn't so bad once you get used to it. Just remember one =
thing.
The stock antenna system does not work very well. It is a rubber duck
without a ground plane (2 strikes). If you connect a decent antenna to it
then it works great. Sensitive with 5 watts out. I own the Azden 6M
mobile radio and like it very much. Fifty watts really gets out. The
summer band openings on 6 are pretty exciting. Have fun.

The DX-60 (or the dixie sixty) is a screen modulated AM/CW xmitter.
The problem with using it on 10 meters, is that usually, by
gentleman's agreement, AM emissions are from 29.000-29.100 or so. This
range is out of the novice privilege area of the 10 meter band.
THe DX-60, though will do CW in the novice range, so there is an
option.

For $40 you can get the RT Systems software for the 51. With this software you can program every function of the radio via the PC. You can also change a setting in the win.ini file and extend the receive range from 66 to 999Mhz without messing around with the transmit side and without taking apart the radio. It works real well except for the 800 stuff. It appears the radio is stone deaf in that region, probably short a few circuits.

It is probable that the loss of poorly matched 75 ohm line will be so much
less than RG cables that you need not worry about matching it. I use
several runs here it looks good at 28 MHz on a Bird 43 into 50 ohms.

However, you can buy transformers from Paul Darwactor, W8ZD, ZD Engineering

Well, a negative one - avoid the Ramsey rig, unless you are fond of major hardware debugging. A recent magazine review, as well as several comments here on the net have also indicated that the kit suffers from severe spurious emissions. According to the review, the kit the author built wouldn't have met FCC requirements, and would have thus been illegal to operate.

The "programmer" is your PC. Also required is a special cable and a
level translator.

You would need special software. I do not know if Motorola would
sell it to you or just to a legitimate radio shop, but I have heard that
it is rather expensive (maybe $800).

I found it is easier to get friendly with some tech at a shop...

Being a person who has bought 1000's of dollars worth of equipment from AES in the last four years, I have been more or less satisfied with the service there with one exception. The service policy at AES states if you buy it here, we will service it for you. If not, take your business elsewhere. Having bought most of the equipment I have from AES, service has not really been a problem. I do have a few items bought used or from swapfests and it leaves somewaht of a bad taste being told sorry, you didn't buy that piece of equipment from AES. Take it somewhere else. That type of policy makes it very easy for a person to take alot of other business elsewhere. Maybe AES is listening. That being said, the service department at AES and in particular the service manager Miles, are top notch techs and very nice people to deal with. I have taken in equipment that I thought was having serious problems to be called and told the problem was was a minor loose wire and is fixed, no charge. They can be trusted to deal fairly when I comes to getting things repaired. That is, if you bought it new from them.

I agree with this comment ... and I have another idea ... why doesn't all those that are unhappy with service and/or price and know how it should be done put up some hard earned cash and start a new ham radio store and show these guys how to do it. Frankly I have bought from AES, HRO and Radio City for many years. Have to admit that Radio City has been most helpful but I have found them all good to deal with .. Only had one problem few years ago with HRO in CO and they really worked to make it right. So, if we know so much about how it should be how about putting capital up and do it right .... Think of all the business that would come it :) Everyone would be rich ... woops that would cause complaint ... better stay poor ... I dont think it is as simple as it looks!

Am still in need of any info on "unlocking" an FT-840...

Also would be interested in whether anyone has experimented
with improving the AM transmit (as well as receive) capability
of the rig, for example by using the optional am filter. Does
it work on transmit as well as receive.

Appreciate any replies, either to mail or this usenet.

Duffy:

You ARE different. You sound like an ethical purchaser. I have seen one of my best friends build a major amateur radio retail
operation from the ground up over about 15 years and spent lots of time assisting him. As a class, hams are among the
cheapest bunch I've seen. I think that a retailer should definitely be customer-driven, and there is no excuse for any rude
treatment. But what will we give the retailer in return? Once he helps some hopeless moron "pick out a radio" for 45 minutes,
the guy will hang up and shop for best price. In fact, he'll kill for an extra two dollars off, cry and whine about shipping, sales
taxes, etc.. Anybody who thinks that there is great margin in the business is quite naive. The only way to make money is to
move mountains of product, breaking your back at hamfests and the like. It's hard work and very few people make good money
at it. In any retail op, chances are that there is one owner making a " decent" (meaning maybe $50-75k/year) living, employing
a bunch of misfits and underacheivers who are making peanuts but enjoy playing with radios. You absolutuely have to LOVE
the hobby to get into the business, and you have to have the patience of a saint. Rude behavior and impatience?...No Way!
But we drive them to it and some crack under the pressure.

Anyone out there familiar with the R4C audio chain? I have noticed a small, random crackle in there, almost like static crashes, but not from the atmosphere. It seems to happen just as much with the RF gain turned down, so I suppose it is in the audio section. I know that Sherwood had a replacement audio amp for the R4C, so they must have spotted the weakness?

Anyway, short of replacing the audio amp, anyone find and cure this problem?

|> ^^^

Gee what a concession! The extended warrenty has to be the biggest ripoff that can be legally perpetrated on a customer! It is a huge profit item for RS, which is why they push them so hard. This young man's purchase of the extended warrenty turned this deal into a very profitable transaction for the store!

Jeffery,

Without question, it is the very best antenna if you don't want to screw
around with resonators or switch whips.

Performance is as good as or better than single band (i.e. Hustler, Telex,
HiGAin, or ?) and you only have to move one plug to make it work. If you
want to spend the money for it, as it is quite pricy, I believe you will
be very pleased with the performance.

It is also extremely rugged, but you have to construct a very secure base
for it to ride on. Other than that, it is as good an antenna as you can
get for mobile operation.

Just bought one last week from Radio City, Minneapolis for $539, and that
was the best price I could find last week.

By the way, I am very pleased by the performance of the radio even in fairly
heavy intermod areas, something I cannot say about Yaesu and Kenwood.

6979. Handheld speaker mics? Yaesu? Generic?

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-28 00:00:00 UTC
From: dd650@cleveland.Freenet.Edu
Message-ID: <3v9qv6$66p@usenet.INS.CWRU.Edu>
Source record: 214624

This evening, I picked up a Radio Shack Speaker/Microphone just to see how well it would work and to see if I would use it. I know the official assessment of RS stuff is frequently pretty low, but I am curious about other sp/mics. Are they much better that this one, which is pretty worthless except that it is light. The speaker on my FT-51r has a lot to be desired, but the speaker in the one I got from Radio SHack is not much better.

I know that Yaesu has the MH-29A2B, but if it sounds anything like this one then it would DEFINATELY not be worth it. What about the 32? How is it's audio? What buttons does the 29 have on top of the unit? I can see what it has on the front of the display form the brochure, but can only barely see what is on the side and top. WHat buttons does the 32 have on it? Are the speakers comparable between these two?

Are there any other generic S/M that are worth considering?

THanks for any feedback!!
Drew

> wire.

Nah, it is a little different. I have been experimenting a little and
found some usefull things.

Here are the mods for the Yaesu FT-51r. Please let me know if you find
additional interesting mods.

1) The following mod will wipe the memory contents of the radio. If you
want to preserve the memory, make a backup of the radio into your PC
(using RS 232 cable) first. You will need a step-up invertor (like
the MAX 232) between the radio and the PC, and on the PC a terminal
program that can handle all bytes (including nulls and Ctrl-Z's).
Use 9600 bps. Hold down the F/M key while turning on, and press the
up arrow as soon as the PC is ready to receive the data. I guess you
understood it already. Now erase the memory, and make another
backup. You will need this 'empty' dump later to compare the
different bit patterns with an empty dump made after the mod, to
patch these differences in the memory backup you want to restore.
Otherwise the radio won't accept the original memory backup after
you made the modification. Of course, you can also use the
commercial software package to program the FT-51r.

2) Remove battery and 6 screws of rear-side radio (behind the keypad).
Also remove the battery removal clip. Loosen the other four
rear-side screws somewhat.

3) Carefully remove the L type plastic cover located behind the keypad.

4) Now locate the solder pads next to the CPU:

0 1
0 2
0 3
0 4
0 5
0 6
0 7

5) Solder pad 6 is for extended TRANSMIT. Be carefull not to burn other components with the solder iron! If this is the only mod, you are ready now! (Go to 13).

6) If you want to fiddle with the band plan of the radio, you need to do the following:

7) Open solder pad 7.

8) Temporary assemble the radio (do not fasten all screws, you will need to open the radio again) and insert the battery.

9) Press and hold Vol UP/Vol DOWN & CALL keys at the same time while you turn the power on. The radio should respond with 'BAND #', where # represents the band lay-out number.

10) Press F/M for a second, and select then a different band by using the up and down keys (NOT THE DIAL!). I found that band 5 is the most interesting. Then press F/M and CALL, and it should automatically power off.

11) Turn on the radio, switch to extended receive (!), and check the VFO limits. The left VFO should run from 60 to 180 MHz, 300 to 512 MHz, and the right one has the same, but IN ADDITION also the range from 700 til 999 MHz! It may be that you need to repeat the process from 9) again but now with the right VFO active to make it work on the right VFO too. I found that sometimes you get different results, there is probably some other yet unknown factor determining what you get too. (Maybe the actual current VFO settings?) Repeating the above process and changing the band numbers again can produce somewhat different results.

12) Open the radio again and close solder pad 7.

13) Now securely close the radio.

14) Restore or reprogram the memories. If you want to restore a dump made on your PC: First make a new (empty) backup. Compare this backup with the one you already had, and note the few differences. Now patch these different bits into your original backup. Now you can restore it. The radio will terminate with an error because the checksum doesn't match, but the memory will be correctly programmed anyway. So who cares? For the purists: the checksum at the end is a simple addition of all previous bytes.

Some remarks: Although the right VFO will be able to tune into the 700 til 999 MHz frequencies, I found that the Yaesu is not able to actually receive anything here. It seems that there are some components missing. Although the other VFO boundaries are now wider, the sensitivity of the radio in these 'extended' areas is poor. The same applies to the RF Power. My RF set ceases to transmit at 500 MHz and above, but other sets may cut off RF Power at higher or somewhat lower frequencies. I also found the area between 60 - 100 MHz of no use, except for extremely poor reception, it also causes interference on the other VFO. But the Mod

is worth experimenting with, and usefull near the boundaries of the original band lay-out.

It is worth noting that with a memory backup made on a PC you can do all kind of weird things. You can change the BCD frequenties to values the radio wouldn't normally accept. If you want to set it to a medium wave frequency, go ahead! Also, even in NON-extended receive mode you can change the frequencies to out-of-band values. It works!

Anyway, please let me know what else you discover.

You will probably never work anybody using AM on the 10 meter novice
band. The vfo is very unstable up there anyway. even if you could
work am there, it would be lousey because of its poor screen grid
modulation. Forget the whole idea. You need an ssb rig to do this.

I really wish you hadn't done this! I stopped responding to the original
poster or any components of this thread because the original poster turned
out to be a no good low down lying repeater jammer. He had most of the info
he needed, and was looking for some clues. As to the need to be a EE, t'aint

so! I'm not one, nor are several folks I know who have figured out the matter.

By the way, as the Control Oper for 3 mountain-top repeaters, I've had more than too much experience with jammers.

I'm really none to comfortable with people discussing elements of how jammers can be caught, or how they can defeat the means of catching them. I've shut down one repeater of ours for several months because I can't control all the users who insist on talking about jammers, how to git 'em, and all the clever tricks jammers come up with.

Wasn't this supposed to be a hobby?
Chris, N7RME
GROL+RADAR, NARTE Certified, AAS-RF Communications (High Honors), AAS-Digital Electronics (High Honors), Cert-Computer Tech (Honors), damn frazzled repeater guy! (no honors, just pooped).

Frans,

Do you know of any reason why jumper 7 should be resoldered? Can
it be left open, to allow easy changing of bands?

Is the radio deaf in the 700-999MHz band on both the left and
right VFOs? I was under the impression that only the 800 to
900MHz portion of the band was blocked.

Tom.

Source record: 214633

Does anyone have suggestions for multi-channel radios on the 900 MHz ham band. The first choice would be something frequency agile and the second would be a unit with several channels. What commercial units, mobile and hand held, can be programmed into the ham band without extensive modification? Most of our hams want a clean looking unit, not something we cob up form pieces and looks like it. Are there any foreign units that would do this? Other countries use this band for CB, trounced and cellular services. We would like to stir up interest in 900 MHz in our area but need a viable source of radios.

Thanks,

Bill Harwood

I am pleased to announce a new product offered by Positive Time Systems
called the RCS-I. This is a radio controller that connects to any VHF/UHF
transceiver and can issue x-10 commands. The unit also has an alarm
input, a listen feature, a short voicmail box, and responds to all
commands in a pleasant female voice. The system IDs with your recorded
voice and call sign.

This description doesn't do the product justice, so
please check out the new homepage at :

>>experience with the Outbacker Mobile Antenna from Terlin Aerials in Australia?

>Without question, it is the very best antenna if you don't want to screw
>around with resonators or switch whips.

Well, the Texas bugcatcher has no resonators or whips to swich. The DK 3
doesn't either. They are both far better radiators than the Outbacker
according to all the research I have seen, including field strength
tests.

>Performance is as good as or better than single band (i.e. Hustler, Telex,
>HiGAin, or ?) and you only have to move one plug to make it work. If you

Not true according to all the research I have seen. The single band,
and very cheap, hamstick radiates better (field strength), I believe
even the hustler does. I forget where I saw the data, but it was in two
places. The Outbacker is about the least efficient mobile antenna
out there - but it IS very convenient and VERY strong.

Anyone have the cite to the field strength tests I recall seeing? It
compared the Hustler, the Texas Bugcatcher, the Hamsticks, the Outbacker
and a few others.

6992. re: HT-220 Synthesizer Wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-28 00:00:00 UTC
From: Michael.Black@juxta.mba.org
Message-ID: <fbd_9507290030@mba.mba.org>
Source record: 214637

visions@news.gate.net (Ray Johnston) is looking for
practically any information on the HT-220 synthesizer
by Dale Heatherington from about 18 years ago.

I have this vague recollection that an article was published
in CQ about it. What I see in my mind was a construction article
complete with a schematic. I also get the feeling that there was
no board layout, and probably if you were interested you were
supposed to get it or a board from the author. I thought it
was Dale himself who authored the article.

Try looking in the annual indexes of CQ at the end of the
year, if you can find a library or somebody with a good
collection of back issues. I've never bought CQ on a
regular basis, but if my memory is correct, I did have that
issue at some point. Why else do I have a vivid recollection?

I thought the article, if it did appear, came out a bit later
than '76. My guess is somewhere around 1978.

That isn't very helpful. I am much more certain that the
basic circuit showed up in 73 some time later, where it had
been adapted to some other rig. I don't know how differernt
the circuit is from the original. I can put my fingers on
that article, given some time and the ability to remember to
check and who needed the information.

Why do you need it? Is it to repair or get going a synthesizer
that you already have, or is it because you want to synthesize
an HT-220? Better devices have come along since, and the circuit
may not be the best choice. Also, what I remember is that it used
some oddball IC that probably cannot be found any longer. The
real secret of the synthesizer, other than having the details worked
out fo the particular rig, was that it was small enough to fit
with the HT-220. I'm sure nobody is selling a blank board for the
project anymore, and unless you can get the PCB layout and make a
board yourself, it will require quite a bit of work to get the
circuit down to that size.

If you need the synthesizer for some other rig, a lot of projects
have been published for various rigs. Not recently, but back when
crystal controlled 2M rigs were most common, and people started
getting tired of crystal control. Right now, I happen to have
a lot of them in one place, the articles that is, and I could
point you to something that might work if I knew exactly what you
needed.

I hope this helps for a start.

7000. re: HT-220 Synthesizer Wanted

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-29 00:00:00 UTC
From: Michael.Black@juxta.mba.org
Message-ID: <036_9507291730@mba.mba.org>
Source record: 214507

visions@news.gate.net (Ray Johnston) is looking for
practically any information on the HT-220 synthesizer
by Dale Heatherington from about 18 years ago.

Okay, it was easier finding the article I was thinking of
than I at first suspected.

The April 1978 issue of 73 had an article "Super Deluxing
the TR33" by Joe Moell, on page 72.

THis article is about a synthesizer for the old (well,
it was relatively new at the time) TR33C 2M portable.

Rather than come up with a new design, the guy took Dale
Heatherington's circuit (and used the bare board available
at the time) and changed it slightly for use with the TR33.

There's a schematic, but it's it's missing pieces from the
HT-220 version. The TR33C used one crystal for both transmit
and receive, so a synthesizer only needed to generate a single
output frequency, rather than switching between two for transmit
and receive.

I was wrong in my earlier post. I was confusing two similar
articles when I said the synthesizer used some oddball IC.
This one does not, and it should be a cinch to get all the parts
for it, or equivalents.

Finally, the article mentions where the original HT-220 article
was. CQ Magazine for February 1977, page 52.

Try contacting CQ to see if you can get a back issue or a reprint
of this article. If I kept that article, I have no idea where it
is now.

>problem?

This sounds like nothing more than a dirty volume control pot. They'll often occasionally emit a crackle even when they aren't being touched. Try cleaning it with Quietrol, and if that doesn't work, replace it.

The main problems with the R4C audio section are hum, poor frequency response, and high THD. You can rework it, but it's simpler just to replace it with an audio output IC operated from a regulated voltage. Several articles have been written detailing this change over the years. I just used a LM386 in mine, but I only needed headphone levels. A higher power audio IC would be better to drive a speaker.

From: mds@lexis-nexis.com
Message-ID: <3vdohg$h3v@meaddata.meaddata.com>
Source record: 214520

The only way you will get a straight answer is to visit your local government office that issues building permits. They will tell you what the current restrictions are for the city.

You may also have neigborhood covenents that may be more restrictive than the city. If you have a neigborhood association they will have a list of restricitions. These damn covenents are more of a problem than city restrictions!

These neigborhood restrictions are created when the builder plots off the land and places restrictions on what can be built. I went to the county office and looked up the neigborhood plot that the builder submitted. The drawings show every lot with survey information. The first drawing had a list of restrictions for these lots. My area was developed in 1968 and antenna restrictions were not very popoular at that time. Today is a different story. With cable TV the builders place "no antenna" restrictions since they see no need for them.

Good luck.

>this kind of meter reading?
>
>Any suggestions would be apprecaited.

Obviously there is a fault somewhere in the system, most likely
either an open or a short. Take an ohmeter, and measure from
center to shield of the jumper coax (disconnect from rig and
measure there, leave connected to the Dentron). If you don't
read close to 50 ohms when the tuner switch is in dummy position,
there's a problem. Next remove the jumper and repeat the measurement
directly at the tuner input connector. If you get 50 ohms there,
it's a bad cable. Otherwise, you'll have to open the tuner up.
Things to look for are a burnt out dummy resistor, a bad switch
contact on the mode switch, burnt wires, bad solder joints, etc.

If you *do* read 50 ohms at the input end of the jumper, then
the problem most likely is in the metering circuit instead.

7015. BC348Q Receiver Alignment

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-29 00:00:00 UTC
From: jschwart@ix.netcom.com
Message-ID: <3vdopn$603@ixnews4.ix.netcom.com>
Source record: 214522

I'd like to refurbish an old BC348Q receiver (great sentimental value). It is sorely in need of an alignment. Can anyone help me with an alignment procedure? I'm also looking for a schematic for the Q version.

Thanks in advance....reply here or by e-mail to jschwart@ix.netcom.com.

John

Ham buddy of mine bought the contents of 3 an/grc-142d tty huts
If you know what they are and want one, give him a call....cool stuff

6-tranceivers RT-834/grc
3-amplifiers am-3349/grc-106 (2-30mhz continuous)
3-mo-522/grc-modem
2 pp-4763/grc 28volt@50 amp power supply
4 an/ugc-74a(v3) teletype unit
We dont know the input power to the amps or the output power yet.
All of them work fine,,he even got the rollup dipoles that came with them.
When hooked up they work great! As soon as we get his shack finished we
will take the lids off and put meters on them. They will tune ANYWHERE
with Excellent power. Some info would be good..ANY info...
If you are interested in buying some of this stuff, im sure that you could
get a GOOD deal. I dont know what they are worth, but i have seen some
untested units in surplus catalogs for an insane price...Surely someone
knows what these are and what to do with them,,,,They are FANTASTIC...
you can fone him at 903-628-3027 (voice) or leave me e-mail at
mikelder@aol.com and I will forward it to him..If you dont want to buy it
, but know something about them please let me know...thanks

7017. Re: would rg-58 be good enough for 2m?

Newsgroup: rec.radio.amateur.equipment

Source record: 214524

RG-58 will have very high loss, or you might say, absorption, at 150 MHz. In any kind of run, you will easily lose half, or more, of your rf power heating up the feedline. Receive will be affected, too. For a short run, like in a mobile, we do it. For base station use, where you may have a longer run of coax, RG-8 (about .4 in in diameter) is about the minimum I'd use. There are better feedlines, too. Belden 9913 or several other makers equivalents, are a bit better, and for really superb results there are various rigid feedlines in various diameters. Some of these rigid feedlines can get up above 5 bucks a foot, though, and connectors are fifty bucks each, so cost comes into it too.

Hi Clark,

I had a similar problem with my R4-C. It turned out to be the V4 (6HS6).
When I tapped on it gently the noise would go away. The gain of this
stage is independent on the RF gain pot. Try to look around before you
change the audio amp.

DB>I noticed that Radio Shack carries a TV antenna rotator, for
DB>something like $69.95. Has anyone ever tried using it?

Ive used one for 10 yrs, still works fine for my 11 ele 2 meter.
Largest antenna Ive turned with it was a full size Channel Master
Quantum VHF yagi which was huge by tv antenna standards, and it worked
fine.

A real irritant, Garth.

Does your Homeowner's insurance cover the loss? Or your auto insurance?

If not, please consider the ARRL's equipment insurance plan. Quite inexpensive, and it's "current-day replacement cost" (YOU set the prices).

And, of course, we ALL should be engraving our states' driver's license numbers on visible, exterior panels - as well as hidden inside locations.

Message-ID: <036_9507291730@mba.mba.org>
Organization: MtlNet (MBA.org) Juxtaposition BBS

visions@news.gate.net (Ray Johnston) is looking for
practically any information on the HT-220 synthesizer
by Dale Heatherington from about 18 years ago.

Okay, it was easier finding the article I was thinking of
than I at first suspected.

The April 1978 issue of 73 had an article "Super Deluxing
the TR33" by Joe Moell, on page 72.

THis article is about a synthesizer for the old (well,
it was relatively new at the time) TR33C 2M portable.

Rather than come up with a new design, the guy took Dale
Heatherington's circuit (and used the bare board available
at the time) and changed it slightly for use with the TR33.

There's a schematic, but it's it's missing pieces from the
HT-220 version. The TR33C used one crystal for both transmit
and receive, so a synthesizer only needed to generate a single
output frequency, rather than switching between two for transmit
and receive.

I was wrong in my earlier post. I was confusing two similar
articles when I said the synthesizer used some oddball IC.
This one does not, and it should be a cinch to get all the parts
for it, or equivalents.

Finally, the article mentions where the original HT-220 article
was. CQ Magazine for February 1977, page 52.

Try contacting CQ to see if you can get a back issue or a reprint
of this article. If I kept that article, I have no idea where it
is now.

I talked to a Denver station this morning on 18Mhz using one of those. It
sounded pretty good even though he was using an attic antenna. He did tell
me
that he does not get any answers on ssb cause of the low power so sticks to
cw.

Very clean sounding signal.

NO!!! Anyone who tells you differently either does not know what he
is talking about, or is trying to get you to destroy your HT. There
are no mods for extending rx or tx ranges.

Source record: 214642

In mid May my DRSI board went out and after hearing that DRSI was not selling the 2-port boards any longer, I decided to buy the new PacCom replacement. I called tham and placed my order. I have yet to see the board and have called tham MANY (7+) times. On each occasion I was told it would be shipped the next day. B.S..... The excuses ranged from production problems to documentation updates.

I called again today (7/28) to cancel my order...(DRSI repaired my board in only 8 weeks or so. Not bad?) This time I told the young lady that I was very disatisfied and was planning to contact the Florida Atty Gen's office to comment. She offered to give me the address for the Fla Atty Gen!!!!!!!! I asked her if she had been thru this before and she said, "Yes, we know how business goes."!

Good GOD. What an outfit. Order at your own risk.

Well, maybe. And maybe, too, to the comments on the DSP-59+ from N0DH.

This is one of those product classes where personal preference, operating style, etc., etc. play the biggest part of which is BEST.

My own experience, having owned too many of them, is that I'd really like to have ALL of the top-of-the-line units. Each one has its strong points, each one has its weak points, and there are times when one or the other will handle a particular interference/noise problem better than the others.

I didn't care much for the MFJ -- found the memory feature frivolous. But, that's a matter of personal operating habits. I find anything more than a dozen or so memories on my HF rig frivolous, too -- as well as the money I spent in the total price for eleventy-four scanning modes. So its a matter of taste. (I wouldn't give up the panoramic display for anything, though).

>something up etc.)

I think you'll find that GPS isn't that expensive anymore, with the tiny Garmin 45 going for $299 and the Magellan Explorer for $199 in the Gander Mtn catalog. Lorans are in the same price range, but I haven't seen any as small as either of these GPS receivers.

And as to antennas, you need a 60 inch FET matched and preamped whip worked against a good groundplane for Loran C while the GPS has a tiny quadrafilar helix that looks like a very short stubby duck sticking out of the receiver, or uses a tiny round patch antenna mounted flush in the case of the receiver.

Neither of these systems work very well indoors. At least with GPS, you have worldwide coverage. Loran C has only limited coverage areas. And Loran will be phased out in the next few years.

I have a King Marine Loran C unit, and an Icom GPS. The GPS loses lock less often, and naturally gives better absolute position fixes. Loran C is, however, more repeatable, IE it can return to a place it has been before more closely than the GPS even though it doesn't really know where that position is in absolute coordinates to great accuracy. Loran signals hug the contour of the Earth, so if you pass behind a large hill, it will think you are further away than you are because it is not measuring as the crow flies, rather as the snail crawls. This is a curse to absolute accuracy, but is a boon to relative accuracy.

Swap out the power supply to see if the power out put problem is solved.
Also when this happens how is the receive ? Disconnect any external
devices like amplifiers, TNC etc to see if any change.

> Thanks in advance....reply here or by e-mail to jschwart@ix.netcom.com.
>
If I were aligning a BC348, I would start with the IF (915 kHz if I
remember) and align it to whatever the crystal filter frequency
really is instead of exactly 915 kHz. Then set the oscillator for
dial calibration (I seem to recall that the coil slugs are adjustable
as well as the trimmer caps - so you can set both low and high ends).
Then peak the mixer and RF amplifier sstages in turn.

It is not the best receiver, but it's not the worst either especially
if you tap off the IF and put it into a BC453 with the front end
modified to tune to 915 kHz. I had one a long time ago and and
really enjoyed it.

>Alkaline cells have enough internal impedance to limit the current
>in case of a short, but NiCads have a very low internal impedance
>and can dump *serious* current if shorted. So NiCad packs have
>internal protective circuits to prevent this from happening.

One source of these "protective circuits" is the RayChen PolySwitch.
The SRP series is usually welded in as a intercell strap, but they can
also be soldered to wires. (never solder directly to a battery)
These have a low, flat profile and can usually be fit in a alkaline
case somwhere and placed in series with the pack wiring.

Model Hold Trip L W T
SRP120 1.2A 2.31A .87 .20 .04
SRP175 1.75 3.44 .91 .20 .04
SRP200 2.00 4.40 .92 .43 .04
SRP350 3.50 6.30 1.25 .53 .04

Other packages looking like disk caps are available also.

At less than $2.00 ea, they are a bit more expensive than a pico fuse,
but the self resetting feature speaks for itself.
Available from many RayChem disty's and Digi-Key 800-344-4539

7062. ACC RC-96 Firmware Question

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-30 00:00:00 UTC
From: cliff@pgh.nauticom.net
Message-ID: <DCJDG7.CMp@pgh.nauticom.net>
Source record: 214462

Hello!

I have version 5.2D firmware. What I'd like to do is change the speech table to add my own words, replacing ones that I do not/would not use.

Does anyone have a memory map?

I've programmed phonemes before and have a speech chip development board for checking out how the new "words" sound before committing them to EPROM.

Next question: Does the controller perform a checksum on the code or just the EEPROM? (I guess I may find out anyways! :-))

Alternatively, I'll get a 8085 disassembler and work from that end.

TIA,

Cliff K3LL

>would allow me to receive out of band?

NO! Sorry to shout, but this comes up a lot. There are *no* out of
band mods for the HTX-202 aside from the MARS/CAP mod. This radio
is purposely narrow banded in order to deliver the superior intermod
performance it offers. There's no way, short of duct taping a scanner
to it, to use it out of band. There's a purported mod circulating on
some BBS systems, it's a hoax. Don't try it, it'll kill the radio.

RG-58 is very lossy at VHF. A very short piece, like in a car, is OK,
but RG-8X minifoam is better. For a regular outdoor antenna, use RG-8,
or better use Belden 9913 or the Wireman's 4XL.

:>Yaesu completely changed out the chips inside the radio. I opened my friend's
:>up (his didn't receive 800, although it could be entered) and compared it to
:>mine (which does receive 800) and they had totally different chips inside
:>the radios. Guess they wanted to make it permanent.

:>-- Patrick KA4ZNU

The difference is not in the chips but in one board. Those boards
have all been sent either to Canada or other countries where the 800
MHz law does not apply.

The Lot 33 and later 530's will indicate the frequencies up there but
there will be absolutely no sensitivity on those freqs.

My 530 is from the Lot 33 bunch and currently receives very well in
the 800-900 MHz range. I managed to get my hands on the board and
swapped it out. I am very impressed with the sensitivity. I was told
it would be in the vicinity of .4uv and although I have not hooked it
up to test equipment I would venture to say that it is more on the
order of <= .2uv.

There is more to listen to than cellular phone (which I could give
rat's passing gas for) in this freq range. Does 902 to 928 MHz ring a
bell?

I do not know where to find anymore of these boards for converting the
newer 530's so please don't ask. If you know someone in Canada it may
be a good start though.

I am considering buying a Ten-Tec radio. My choices are down to the Paragon and the Paragon2. There is a big cost difference between the two. I can find the paragon for about 1400.00 (used) and the paragon2 is 2385 new. I was wondering if there was an appreciable difference between these two rigs that would make it worth it to spend the extra money? I operate some cw but mostly ssb. If anybody owns a paragon your impression would be appreciated. I can assume it is good gear because of the lack of availability of it on the used market. The reason I want either the paragon or the paragon2 is because of the general coverage receive, otherwise I would get the OMNI VI. Any comments are appreciated. I am considering MARS operation and would like to know if these rigs are MARS capable. Thanks

This is all true but if you have a local Radio Shack "clearance" center like we have here in
Toronto, you can often find 20' and 50' runs of RG-58 with connectors for a little as 2-3$. I am
using alot of this now (about 4 or 5 runs) with a maximum of about 50' for scanners, and monitor rxcvrs
and it works great. I am also running a 25w VHF packet rig and a 30W Icom commercial UHF radio
through this to antennas on the roof and have had no problems although I suspect the signal loss is
quite high. However, I can access any repeater (on UHF) and packet station (on VHF) that I need so
despite the poor quality of the cable, it works fine in my application.

From: unclewsw@aol.com
Message-ID: <3vhd64$f6u@newsbf02.news.aol.com>
Source record: 214476

Hi,

I bought an Argonaut II several years ago but have not used it much.
My primary use was for a QRP field day. Everything else went wrong but
the radio was fine (Ever hear of O'Tooles Law? Murphy was an optimist!).
I received one report from North Carolina that I had the strongest signal
there for about 15 seconds. Everyone reported good audio. Well, everyone
I contacted in the last 15 minutes of Field Day that is...

Other comments: The main tuning knob doesn't appear to be "centered"
on my rig, it appears to wobble as it turns. It hasn't caused any
problems yet. My rig seemed to be locked up (non responsive to the front
panel) but it has resolved itself. Perhaps it was the Lithium battery
that I had to replace...

I have one of the early versions: My first manual was a temporary
until the official one came out. These glitches may have been ironed out
by now.

Overall, I really like the radio. It's actually fun to use.

7085. Need help/info on Molicel Rechargable Lithium Battery Pack

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-30 00:00:00 UTC
From: Norm_Beasley@sil.ORG
Message-ID: <01HTFPLWUMDU0020QB@SIL.ORG>
Source record: 214549

Greetings All,

A friend of mine has an Icom IC-2AT which he recently purchased, used, over here in PNG. The only battery pack supplied with this radio is a Molicel Rechargable Lithium Battery pack. It is a "commercially" (mass produced ?) made unit, as appears from the circuit board. As viewed from the front, on the lower right hand side of the battery pack case, there are 5 LEDs (grn, grn, grn, yel, red), and a push button that work together to show battery status. On the rear of the case is a small DC power jack for charging. The battery case appears to be a modified Icom BP-4 battery case or a gutted battery pack (case). The case slides on to the Icom IC-2AT battery rails.

The individual cell pack appears to have 6 x "AA" size cells in it. The 6 cells are all wrapped in a "shrink wrap" type case, to hold the cells together. The numbers on the plastic shrink wrap appear to be: JB - ME31008-E 343-8712

The charger for the Molicel was sold by the previous owner to some one else, by mistake.

Has anybody out there used a Molicel pack as described? We need some help coming up with some information as to how to charge the unit. At how many volts? At how much current? Any other information would be appreciated, esp. History; Good/bad points of Lithium batteries; Caring for lithium, as opposed to NiCad, battery packs; Information on Molicel the company; Address for Molicel; etc.

Thanks in advance for reading this message and passing on iny info.

Cheers and 73,

7086. Problem with Kenwood TR751A/Brian, pls put on ham-equip dig.

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-30 00:00:00 UTC
From: Norm_Beasley@sil.ORG
Message-ID: <01HTFPLVVIVY0020QB@SIL.ORG>
Source record: 214550

Hey all,

I recently moved homes here in Papua New Guinea and when I plugged my TR-751A into my battery after the move, it seemed to have died. No "beep" on power up, no backlighting to LCD display, no digits on LCD display.

Power to radio is from a N100 battery with 12.38 volts across terminals, power to radio is confirmed. When connected to battery, the quick disconnect plug shows 2.78 volts or so across the "+" and "-" leads. Power drain with a Beckman DVM in line is 70uA (microamps), regardless of state of ON/OFF switch.

I was having problems with one of the LCD panel backlighting LEDs and the light to the meter was not working. I had attributed this to vibration from a vehicular installation. Now I am not sure.... In the past, out of frustration, I "thumped" the radio with the heel of my hand, and the (only working) LCD backlight LED went off. Another "thump" or two and it might come back on.

No joy with the meter lights though. Thumping the radio didn't help them come on. I did notice that the S-meter needle would periodically jump from 0 (zero) to full scale. Other times, there would be a brief meter movement to maybe half scale. During the meter movement there was no audio signal present, the green LED behind the "busy" indicator wasn't coming on, and the red LED behind the "on air" glowed constantly at 1/4(?) brilliance. Still other times, when receiving a strong signal the meter shows a solid full scale movement

I wish now I had sprung for the Service Manual for this radio....

Has anybody out there had any problems like this?? Would any of these problems be related to a dead (or dying) battery that looks after the memories? Can anybody help me with troubleshooting via modem??

I am returning to USA in September and if all else fails, I'll send it to Kenwood for servicing.

Thanks in advance.

>==========

If the board is different, would it not follow that the chips are
different? The boards in the two I looked at had the exact same layout
and components except for the two VLSI (I think that they are VLSI) chips
that were labelled with totally different numbers and manufacturers. The
two radios I looked at also had terrible receivers (as checked on a
Motorola communications analyzer). I sold my '530 and got an FT-11R HP.
This receiver tested way better than the '530, it was so sensitive that
the analyzer could not get below the noise floor of the receiver (the
output of the analyzer was .03uV). I think that the '530 may have needed
a little more design work on it but I sure did love all the bells and whistles
on it !!

It depends if the power loss is enough to matter to you, and if you're any good at attaching connecters. I don't have the loss figures for RG-58 here (especially since there are several different types), but you could look it up in many antenna books (also the ARRL Handbook). From this, go ahead and figure the power loss for each case, and see if it's enough to make you care.

>>>I didn't care much for the MFJ -- found the memory feature frivolous. But, that's a matter of personal operating habits. I find anything more than a dozen or so memories on my HF rig frivolous, too -- as well as the money I spent in the total price for eleventy-four scanning modes. So its a matter of taste. (I wouldn't give up the panoramic display for anything, though).

Grant/NQ5T<<<

That's right Grant. I do like the memory feature, and the fact that the CW frequency control is in smaller steps, the spotting tone, and so on, but I think the digital mode filters are a waste of panel space! Than again, I am a serious weak signal low band DX'er, if I only worked casual SSB I would buy the Radio Shack, hi. I agree on the radio. I bought the closest thing to a modern Drake Twin I could.

You also could encounter "tilt" in the frequency response depending on the coupling method. For example, if a high Z capacitive coupled source is used to drive a low Z load the response would roll off at low frequencies. If a high Z inductive or resistive coupled source were used to drive a low Z load with shunt capacitance the highs would roll off. The effect varies with component selection and circuit type.

:>-- Patrick Riggins KA4ZNU
:> Knoxville, TN

Of course you realize that newer technology is employed into the
FT-11R. I would expect the sensitivity would be somewhat better. I
believe that I happened to get a very nice radio. I haven't done the
12dB SINAD test on mine but the figures I gave were just a guess based
on the figures from the manual.

If it would make you happy, the next chance I get I'll hook up my
radio to an analyzer and let you know what the MDS level is.

BTW: I bet your dog is bigger than mine...and that you can run
faster, jump higher, and leap tall buildings better than I can. Gosh,
Superman it sure is nice to meet you here on the net.

We opened up two '530s, approx. 15 mos. different manuf. date. What we found was that the firmware version was different. It appears they changed the code to not allow certain freq. ranges; pretty easy in the code. Now the big question; ...change the PROM??? Do you feel lucky today??? Sounds like a business oppertunity!

From: tschuld@gpu.srv.ualberta.ca
Message-ID: <3viv7r$qqo@rover.ucs.ualberta.ca>
Source record: 214425

Hello,
I picked up this Electro Voice mic with some Drake B twins. Apparently the mic was made for the Drake radios specifically. Can anyone comment? When were these mics produced, and what was the overall impression? I haven't had the chance to be on the air with it yet, until the antenna is up (soon).
Also, I would appreciate others experience with the following. I also have a Drake 7075 mic and a D104 wired for Drake radios. I have a Kenwood TS520SE, and have heard that the D104 was a good match for that radio. I am considering springing the D104 for the Kenwood. The other possible mic for the Kenwood radio is a Turner SSB+2. Would the Turner be good enough for the Kenwood, or is the D104 better served with that radio? I realize that this is a very subjective thing, and that people's voices are quite different, but others I'm sure have gone down this path before and I would appreciate the observations.
Thanks,
Chris VE6RDC

Source record: 214426

Bob,
I ran into a similar problem with at ICOM Autotuner for the IC-735 radio. The tuner would not tune the out of band (especially 4 MHz) MARS frequencies in the autotune mode. On this particular tuner, you could switch between auto tuning and some 'preset' settings. In the preset settings, you had two adjustments which would allow the tuner to be skewed. We were able to bring the SWR down to 1:1. When operating on the other bands would use the autotune mod. When using the 4 MHz band would select preset and the tuner would go ahead and tune. Not sure the same features are available on your particular tuner.

For your house, before you spend a lot of $$$, try making a "floppy quarter wave" out of a coax connector and copper wire. set it on top of a length of PVC pipe and run the coax through the pipe. It works much better than the rubber antenna and costs only a few bucks to make.

If you need a bit more than that, the colinear base station antennas made by Lakeview company are hard to beat. The price is right too. ($22 or so).

As far as telescoping antennas go, I tried a AEA "hot rod" antenna. It seemed to work better than the Icom rubber antenna, but when I hooked it to my SWR analyzer I couldn't get the meter to unpin (swr 3:1++) anywhere on the ham band. The Hotrod now resides in the junk drawer.

From: cingersn@bdam.win.net
Message-ID: <26@bdam.win.net>
Source record: 214432

I have a YAESU FT-901DM HF XCVR and was wondering if anyone knows how I might squeeze a little more of the 80M band out of it. I am a member of Navy MARS and need to get to 4.045.0mhz. I can get to 4.034.5 but that is it! Our traffic is obtained from the mailbox on 4.045.0!! Kinda puts me in a bind. Any assistance will be greatly appreciated.

Thanks es 73 de Carl N1DXM/NNN0HLC (MARS)

Subject: Handheld speaker mics? Yaesu? Generic?

>>This evening, I picked up a Radio Shack Speaker/Microphone...

I use mine with my HTX-202, and it has performed just fine. (Catalog 19-310). Not pretty, but quite functional.

>>Are there any other generic S/M that are worth considering?

I use Standard's CMP-115 on a couple of units. It's close to being a "mini" speaker/mike. Works ok...but my favourite is my Icom HM-54. A solid handful of a mike.

I also use Motorola's NMN6196A on Visars. Probably the best built.

The HTX-202 is a reliable, solid performer. The vast majority of owners
are experiencing absolutely NO problems whatsoever with their units.

From what I am reading in many of the threads are re-hashing of old
horror stories. Also, many people do not read their manuals to discover
answers to some of their problems.

I am willing to make repairs to ham gear and test equipment. I live in the Los Angeles area and have a lot of experience, and references. This isn't a commercial enterprise, but I like working on this stuff and maybe I can make a small amount of money in the process. I don't want to ship heavy gear, though.

I have pretty much all the equipment I need: meters, generators, 'scopes, etc. Even a tube tester! As long as your gear hasn't been butchered, and if you have a service manual, let me take a look at it. About the only thing I won't work on is an HT, or I guess a poorly assembled kit.

Well, maybe I have more disposable income than good sense, but I just could not see getting the extended warranty on either the HTX-202 or the -404 that I bought while they were on sale. At $230 or less each during the sale, my feeling is that if they work for the period under which waranteed, they are essentially a throwaway item, just like a VCR that requires much of any service after the warranty has expired.

It has been my experience with consumer electronic items, computers in particular, that if they are not DOA out of the box, they will work fairly well for a reasonable amount of time. One cannot expect such items to work forever, without an occasional need for repair. Items like disk drives and monitors have a finite life.

I suppose that a ham on a budget might consider the extended warranty as a justifiable expense. It is a crapshoot, depending on ones ability to pay out-of-pocket for repairs or replacement of equipment.

From: misc1102@csc.canterbury.ac.nz
Message-ID: <1995Jul31.110318@cantva>
Source record: 214486

I am aware that if I press the down arrow (ie scan down) from 800Mhz on the FT-530 I can scan BELOW 800Mhz (to a certain extent).

Everyone knows that pressing the up and down arrows on power-on opens up the extended receiver coverage permanently until the next cpu reset (VFO and MR on power-on).

Does anyone know how to open up out-of-band transmit capability?

THANKS,
ZL3TWO

7129. Gould SMG 5-300 Switch Pow. Sup.

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-31 00:00:00 UTC
From: dbr@alumni.caltech.edu
Message-ID: <3vh76d$qga@gap.cco.caltech.edu>
Source record: 214487

I recently purchased a Gould SMG 5-300 Switching Power Supply at
a swapmeet. This unit originally put out 300 amps of 5 VDC into
two output circuits. These were cleverly arranged so that they
could be ganged and output (I would guess) about 150 amps at 13.8 V.
The unit has been modified to work on 115VAC and sems to work fine.
I would like to be able to modifiy so that it can run on either
115VAC or 230VAC (originally it could do this before the modification
took it from 230 service to 115 service). If someone out there
has a manual and/or schematics and/or sage advice, I would be happy
to pay for borrowing your manual, copying it and FedExing it back to
you. The unit looks like it was built in the late 1978/early 1979
time frame. The input fuses are both rated at 40A/250V. If you
know anything about this model -- especially dos and don't -- please
let me know -- 300 amps is a scary amount of current especially as
the house circuit breakers will be tripping long before the fuses go.
Thanks in advance! '73 N6DLU

I have the Paragon II and love it. I never tried it on any MARS freqs
so I am not sure of the coverage.

I would suggest that you call the folks at Ten-Tec and ask them what
the difference is between the newer and the older models. They
typically have some of the older Paragons in stock that they received
on trade-in so if you decide on the Paragon you can buy it from them
and they will back the radio.

Sure am glad I bought one over the imported rice boxes, what a
difference in audio quality and over all construction quality!

Gosh, everyone says that I bash RS too much. Time after time I keep reading about this RS rig and that RS rig broke. I bash them on quality and it appears from reading yet another post, that the quality of these RS imports is lacking tremendously.

The funny thing about it is RS is making more money off these quality problems by convincing the customers to buy their extended warranties to protect them against poor quality. I just don't get it. And they say the consumer is getting more intelligent?

Hello and Thanks for Reading,

I am posting this message for a friend who does not have net access.

He is selling a Bondwell B200 XT laptop.
The Unit contains 2 batteries(with charger/adapter), and 2 DD 3 "Disk
drives
It also has 640K Ram and External color Monitor, printer, and serial
ports
The display is mono, and it does not have any hard drive.

The asking price is $200.00, but he may be willing to come down in price.

If interested please phone Chad Nelson KF9RU (715)-675-4025.
Please do not e-mail replies, as I stated before this is third party.

This would be a great unit for portable packet operation

Thanks again

7139. ACC Repeater Controllers Closes

LAST CALL FOR VOTES (of 2)
unmoderated group rec.audio.tubes

Newsgroups line:
rec.audio.tubes Electronic audio circuits which use vacuum tubes.

Votes must be received by 29:59:59 UTC, 9 Aug 1995.

This CFV will also be sent to the following mailing list(s):

The Bottom Line (bass players' email digest) bass@magpie.com

This vote is being conducted by a neutral third party. For voting
questions only contact Terry Bartlett <bartlett@legion.central.sun.com>.
For questions about the proposed group contact Reid Kneeland <reid@tti.com>.

CHARTER

Rec.audio.tubes is dedicated to the discussion of vacuum tube
audio equipment, including the following topics:

* hi-fi applications
* guitar (and other instrument) amplifiers
* radio circuits
* theory and design
* vintage and modern equipment
* repair/modification/restoration
* purchase recommendations

Participants from all backgrounds are welcome. Polite expressions of
opinion are welcome. Personal attacks and flame-wars are not. Let's
keep things civil, informative, and fun.

RATIONALE

Although the transistor and its relatives have largely replaced vacuum
tubes in modern electronic products, there remains a substantial set of
people who, for various reasons, use tube (or "valve") equipment,
and there remain many companies which produce such products. There are
also a great many "vintage" audio products of various types which often
need to be modified, repaired or restored. There are a number of
special issues associated with tube electronics that are not of concern
to most users of audio equipment, and there is currently no one place
for discussion of these topics on the Net.

HOW TO VOTE

Send MAIL to: voting@legion.central.sun.com
Just Replying should work if you are not reading this on a mailing list.

Edit the ballot below so that your mail message contains one of the following statements:

I vote YES on rec.audio.tubes
I vote NO on rec.audio.tubes

You may also ABSTAIN in place of YES/NO - this will not affect the outcome. Anything else may be rejected by the automatic vote counting program. The votetaker will respond to your received ballots with a personal acknowledgement by mail - if you do not receive one within several days, try again. It's your responsibility to make sure your vote is registered correctly.

7141. ### I need info/mods on Kenwood TH-22AT Handhelds

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-31 00:00:00 UTC
From: 93102208@comet.np.ac.sg
Message-ID: <3vir8f$3i1@comet.np.ac.sg>
Source record: 214499
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.misc

I'm interested in purchasing a TH-22AT, however, silly as this may sound, I need mods for it.

I need to restrict it to RX and TX from 144-146 -ONLY-. It's a requirement by our licencing here (Singapore) before the equiptment can be 'type approved'. Long story, I shan't go into it.

Preferably, a mod that can be reversed.

Oh yes, I'd also like the mods for expanded RX/TX if any are available, and if there are any keypad mods/tricks.

This is posted to r.r.swap as I'd like to know if there are any technical manuals or the like for the TH-22AT where I can purchase to help me figure out how to restrict the RX/TX if possible.

Alternatively, anyone knows of any nice HTs that can be restricted to 100% TX/RX from 144-146 only?

Thanks for any info.

7142. ### I want info/mods/used HTX202 Handheld

Newsgroup: rec.radio.amateur.equipment
Date: 1995-07-31 00:00:00 UTC
From: 93102208@comet.np.ac.sg
Message-ID: <3vis4d$3vm@comet.np.ac.sg>
Source record: 214500
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap,rec.radio.amateur.misc

I'm looking for a 2nd hand HTX-202, I'm on a tight budget, but if you've got one to let go off, email me, and let me know how much you're willing to part from it.

The info I require on the HTX-202 is what is the TX/RX range. I've been reading thru my old collection of texts on the unit, and it just keeps mentioning RX in the ham bands. Is it safe for me to assume it RX strictly from 144-148 only?

If I need to mod it to RX/TX from 144-146 only, how can I go about doing this? Anyone out there can help advise?

In one of the old posts I was reading regarding the HTX-202, it had a para that read:

"Repeater offset can be adjusted from 0 to 4 MHz in steps as set
by the scan frequency step selection (5, 10, 20, 25, 50 or 100
KHz)."

I don't understand this. 8(- Perhaps I'm just not familar with the terms. What does it mean?

Thanks for any info provided... Email response is prefered.

Rgds!

Ed, 9V1ZY.

7143. WTB: NEC tone reeds for 584.8 Hz
